# Contents

<b>1</b>	<b>The Mark3 Realtime Kernel</b>	<b>1</b>
<b>2</b>	<b>Preface</b>	<b>3</b>
2.1	Who should read this . . . . .	3
2.2	Why Mark3? . . . . .	3
<b>3</b>	<b>Can you Afford an RTOS?</b>	<b>5</b>
3.1	Intro . . . . .	5
3.2	Memory overhead: . . . . .	6
3.3	Code Space Overhead: . . . . .	7
3.4	Runtime Overhead . . . . .	7
<b>4</b>	<b>Superloops</b>	<b>9</b>
4.1	Intro to Superloops . . . . .	9
4.2	The simplest loop . . . . .	9
4.3	Interrupt-Driven Super-loop . . . . .	10
4.4	Cooperative multi-tasking . . . . .	11
4.5	Hybrid cooperative/preemptive multi-tasking . . . . .	12
4.6	Problems with superloops . . . . .	13
<b>5</b>	<b>Mark3 Overview</b>	<b>15</b>
5.1	Intro . . . . .	15
5.2	Features . . . . .	15
5.3	Design Goals . . . . .	16
<b>6</b>	<b>Getting Started</b>	<b>17</b>
6.1	Kernel Setup . . . . .	17
6.2	Threads . . . . .	18
6.2.1	Thread Setup . . . . .	18
6.2.2	Entry Functions . . . . .	19
6.3	Timers . . . . .	19
6.4	Semaphores . . . . .	20
6.5	Mutexes . . . . .	21

6.6	Event Flags	21
6.7	Messages	22
6.7.1	Message Objects	22
6.7.2	Global Message Pool	23
6.7.3	Message Queues	23
6.7.4	Messaging Example	23
6.8	Sleep	24
6.9	Round-Robin Quantum	24
<b>7</b>	<b>Inside The Scheduler</b>	<b>25</b>
7.1	A Bit About Threads	25
7.2	Thread States and Thread Lists	25
7.3	About Blocking and Unblocking	26
7.4	The Scheduling Algorithm	26
7.5	Considerations For Round-Robin Scheduling	28
7.6	Context Switching	28
7.7	Putting It All Together	28
<b>8</b>	<b>Porting Mark3 - An Example Using ARM Cortex-M0</b>	<b>31</b>
8.1	Thread Stack Initialization	32
8.2	Kernel Startup	33
8.3	First Thread Entry	34
8.4	Context Switching	34
8.5	Kernel Timers	35
8.6	Critical Sections	36
8.7	Conclusion	37
<b>9</b>	<b>Build System</b>	<b>39</b>
9.1	Source Layout	39
9.2	Building the kernel	39
9.3	Building on Windows	40
9.4	Exporting the Source	41
9.4.1	Supported targets	41
<b>10</b>	<b>License</b>	<b>43</b>
10.1	License	43
<b>11</b>	<b>Profiling Results</b>	<b>45</b>
11.1	Date Performed	45
11.2	Compiler Information	45
11.3	Profiling Results	45

<b>12 Code Size Profiling</b>	<b>47</b>
12.1 Information	47
12.2 Compiler Version	47
12.3 Profiling Results	47
12.4 Information	48
12.5 Compiler Version	49
12.6 Profiling Results	49
<b>13 Hierarchical Index</b>	<b>51</b>
13.1 Class Hierarchy	51
<b>14 Class Index</b>	<b>55</b>
14.1 Class List	55
<b>15 File Index</b>	<b>59</b>
15.1 File List	59
<b>16 Class Documentation</b>	<b>65</b>
16.1 Atomic Class Reference	65
16.1.1 Detailed Description	65
16.1.2 Member Function Documentation	65
16.1.2.1 Add	65
16.1.2.2 Set	66
16.1.2.3 Sub	66
16.1.2.4 TestAndSet	66
16.2 BitStreamer Class Reference	67
16.2.1 Detailed Description	67
16.2.2 Member Function Documentation	67
16.2.2.1 AdvanceByte	67
16.2.2.2 Init	67
16.2.2.3 ReadBits	68
16.3 BlockHeap Class Reference	68
16.3.1 Detailed Description	69
16.3.2 Member Function Documentation	69
16.3.2.1 Alloc	69
16.3.2.2 Create	69
16.3.2.3 Free	69
16.3.2.4 IsFree	69
16.4 BlockingObject Class Reference	70
16.4.1 Detailed Description	70
16.4.2 Member Function Documentation	70

16.4.2.1	Block	70
16.4.2.2	LockAndQueue	71
16.4.2.3	UnBlock	71
16.4.2.4	UnLock	71
16.5	ButtonControl Class Reference	72
16.5.1	Detailed Description	72
16.5.2	Member Function Documentation	73
16.5.2.1	Activate	73
16.5.2.2	Draw	74
16.5.2.3	Init	74
16.5.2.4	ProcessEvent	74
16.6	CheckBoxControl Class Reference	74
16.6.1	Detailed Description	75
16.6.2	Member Function Documentation	75
16.6.2.1	Activate	75
16.6.2.2	Draw	75
16.6.2.3	Init	76
16.6.2.4	ProcessEvent	76
16.7	CircularLinkedList Class Reference	76
16.7.1	Detailed Description	77
16.7.2	Member Function Documentation	77
16.7.2.1	Add	77
16.7.2.2	Remove	77
16.8	CommandLine_t Struct Reference	77
16.8.1	Detailed Description	78
16.9	DCPU Class Reference	78
16.9.1	Detailed Description	80
16.9.2	Member Function Documentation	80
16.9.2.1	AddPlugin	80
16.9.2.2	GetOperand	80
16.9.2.3	GetRegisters	80
16.9.2.4	HWN	80
16.9.2.5	IAQ	80
16.9.2.6	Init	80
16.9.2.7	RFI	82
16.9.2.8	SendInterrupt	82
16.9.3	Member Data Documentation	82
16.9.3.1	m_clPluginList	82
16.10	DCPU_Registers Struct Reference	82
16.10.1	Detailed Description	82

16.11DCPUPlugin Class Reference . . . . .	83
16.11.1 Detailed Description . . . . .	83
16.11.2 Member Function Documentation . . . . .	84
16.11.2.1 Enumerate . . . . .	84
16.11.2.2 GetDeviceNumber . . . . .	85
16.11.2.3 Init . . . . .	85
16.11.2.4 Interrupt . . . . .	85
16.12DevNull Class Reference . . . . .	85
16.12.1 Detailed Description . . . . .	86
16.12.2 Member Function Documentation . . . . .	86
16.12.2.1 Close . . . . .	86
16.12.2.2 Control . . . . .	86
16.12.2.3 Open . . . . .	87
16.12.2.4 Read . . . . .	87
16.12.2.5 Write . . . . .	87
16.13DoubleLinkedList Class Reference . . . . .	88
16.13.1 Detailed Description . . . . .	88
16.13.2 Member Function Documentation . . . . .	88
16.13.2.1 Add . . . . .	88
16.13.2.2 Remove . . . . .	89
16.14DrawBitmap_t Struct Reference . . . . .	89
16.14.1 Detailed Description . . . . .	89
16.15DrawCircle_t Struct Reference . . . . .	90
16.15.1 Detailed Description . . . . .	90
16.16DrawEllipse_t Struct Reference . . . . .	90
16.16.1 Detailed Description . . . . .	91
16.17DrawLine_t Struct Reference . . . . .	91
16.17.1 Detailed Description . . . . .	91
16.18DrawMove_t Struct Reference . . . . .	91
16.18.1 Detailed Description . . . . .	92
16.19DrawPoint_t Struct Reference . . . . .	92
16.19.1 Detailed Description . . . . .	92
16.20DrawPoly_t Struct Reference . . . . .	92
16.20.1 Detailed Description . . . . .	93
16.21DrawRectangle_t Struct Reference . . . . .	93
16.21.1 Detailed Description . . . . .	93
16.22DrawStamp_t Struct Reference . . . . .	94
16.22.1 Detailed Description . . . . .	94
16.23DrawText_t Struct Reference . . . . .	94
16.23.1 Detailed Description . . . . .	95

16.24DrawVector_t Struct Reference . . . . .	95
16.24.1 Detailed Description . . . . .	95
16.25DrawWindow_t Struct Reference . . . . .	95
16.25.1 Detailed Description . . . . .	96
16.26Driver Class Reference . . . . .	96
16.26.1 Detailed Description . . . . .	97
16.26.2 Member Function Documentation . . . . .	97
16.26.2.1 Close . . . . .	97
16.26.2.2 Control . . . . .	97
16.26.2.3 GetPath . . . . .	97
16.26.2.4 Open . . . . .	98
16.26.2.5 Read . . . . .	98
16.26.2.6 SetName . . . . .	98
16.26.2.7 Write . . . . .	98
16.27DriverList Class Reference . . . . .	99
16.27.1 Detailed Description . . . . .	99
16.27.2 Member Function Documentation . . . . .	99
16.27.2.1 Add . . . . .	99
16.27.2.2 FindByPath . . . . .	99
16.27.2.3 Init . . . . .	99
16.27.2.4 Remove . . . . .	100
16.28EventFlag Class Reference . . . . .	100
16.28.1 Detailed Description . . . . .	101
16.28.2 Member Function Documentation . . . . .	101
16.28.2.1 Clear . . . . .	101
16.28.2.2 ClearTransaction . . . . .	101
16.28.2.3 GetMask . . . . .	101
16.28.2.4 ProcessQueue . . . . .	102
16.28.2.5 Set . . . . .	102
16.28.2.6 SetTransaction . . . . .	102
16.28.2.7 TimeoutTransaction . . . . .	102
16.28.2.8 Wait . . . . .	102
16.28.2.9 Wait . . . . .	103
16.28.2.10WaitTransaction . . . . .	103
16.29FixedHeap Class Reference . . . . .	103
16.29.1 Detailed Description . . . . .	104
16.29.2 Member Function Documentation . . . . .	104
16.29.2.1 Alloc . . . . .	104
16.29.2.2 Create . . . . .	104
16.29.2.3 Free . . . . .	105

16.30Font_t Struct Reference . . . . .	105
16.30.1 Detailed Description . . . . .	105
16.31GamePanelControl Class Reference . . . . .	105
16.31.1 Detailed Description . . . . .	106
16.31.2 Member Function Documentation . . . . .	106
16.31.2.1 Activate . . . . .	106
16.31.2.2 Draw . . . . .	106
16.31.2.3 Init . . . . .	106
16.31.2.4 ProcessEvent . . . . .	107
16.32GlobalMessagePool Class Reference . . . . .	107
16.32.1 Detailed Description . . . . .	107
16.32.2 Member Function Documentation . . . . .	107
16.32.2.1 Pop . . . . .	107
16.32.2.2 Push . . . . .	108
16.33Glyph_t Struct Reference . . . . .	108
16.33.1 Detailed Description . . . . .	108
16.34GraphicsDriver Class Reference . . . . .	108
16.34.1 Detailed Description . . . . .	110
16.34.2 Member Function Documentation . . . . .	110
16.34.2.1 Bitmap . . . . .	110
16.34.2.2 Circle . . . . .	110
16.34.2.3 DrawPixel . . . . .	110
16.34.2.4 Ellipse . . . . .	110
16.34.2.5 Line . . . . .	111
16.34.2.6 Move . . . . .	111
16.34.2.7 Point . . . . .	111
16.34.2.8 ReadPixel . . . . .	111
16.34.2.9 Rectangle . . . . .	111
16.34.2.10SetWindow . . . . .	111
16.34.2.11Stamp . . . . .	112
16.34.2.12Text . . . . .	112
16.34.2.13TextFX . . . . .	112
16.34.2.14TriangleFill . . . . .	112
16.34.2.15TriangleWire . . . . .	112
16.35GroupBoxControl Class Reference . . . . .	113
16.35.1 Detailed Description . . . . .	113
16.35.2 Member Function Documentation . . . . .	113
16.35.2.1 Activate . . . . .	113
16.35.2.2 Draw . . . . .	114
16.35.2.3 Init . . . . .	114

16.35.2.4 ProcessEvent	114
16.36GuiControl Class Reference	114
16.36.1 Detailed Description	117
16.36.2 Member Function Documentation	117
16.36.2.1 Activate	117
16.36.2.2 ClearStale	117

# Chapter 1

## The Mark3 Realtime Kernel

--[Mark3 Realtime Platform]-----

Copyright (c) 2012-2013 Funkenstein Software Consulting, all rights reserved.  
See license.txt for more information

The Mark3 Realtime [Kernel](#) is a completely free, open-source, real-time operating system aimed at bringing multi-tasking to microcontroller systems without MMUs.

It uses modern programming languages and concepts (it's written entirely in C++) to minimize code duplication, and its object-oriented design enhances readability. The API is simple - there are only six functions required to set up the kernel, initialize threads, and start the scheduler.

The source is fully-documented with example code provided to illustrate concepts. The result is a performant RTOS, which is easy to read, easy to understand, and easy to extend to fit your needs.

But Mark3 is bigger than just a real-time kernel, it also contains a number of class-leading features:

- Device driver HAL which provides a meaningful abstraction around device-specific peripherals.
- Capable recursive-make driven build system which can be used to build all libraries, examples, tests, and documentation for any number of targets from the command-line.
- Graphics and UI code designed to simplify the implementation of systems using displays, keypads, joysticks, and touchscreens
- Standards-based custom communications protocol used to simplify the creation of host tools
- A bulletproof, well-documented bootloader for AVR microcontrollers

## Chapter 2

# Preface

### 2.1 Who should read this

As the cover clearly states, this is a book about the Mark3 real-time kernel. I assume that if you're reading this book you have an interest in some, if not all, of the following subjects:

- Embedded systems
- Real-time systems
- Operating system kernel design

And if you're interested in those topics, you're likely familiar with C and C++ and the more you know, the easier you'll find this book to read. And if C++ scares you, and you don't like embedded, real-time systems, you're probably looking for another book. If you're unfamiliar with RTOS fundamentals, I highly suggest searching through the vast amount of RTOS-related articles on the internet to familiarize yourself with the concepts.

### 2.2 Why Mark3?

My first job after graduating from university in 2005 was with a small company that had a very old-school, low-budget philosophy when it came to software development. Every make-or-buy decision ended with "make" when it came to tools. It was the kind of environment where vendors cost us money, but manpower was free. In retrospect, we didn't have a ton of business during the time that I worked there, and that may have had something to do with the fact that we were constantly short on ready cash for things we could code ourselves.

Early on, I asked why we didn't use industry-standard tools - like JTAG debuggers or IDEs. One senior engineer scoffed that debuggers were tools for wimps - and something that a good programmer should be able to do without. After all - we had serial ports, GPIOs, and a bi-color LED on our boards. Since these were built into the hardware, they didn't cost us a thing. We also had a single software "build" server that took 5 minutes to build a 32k binary on its best days, so when we had to debug code, it was a painful process of trial and error, with lots of Youtube between iterations. We complained that tens of thousands of dollars of productivity was being flushed away that could have been solved by implementing a proper build server - and while we eventually got our wish, it took far more time than it should have.

Needless to say, software development was painful at that company. We made life hard on ourselves purely out of pride, and for the right to say that we walked "up-hills both ways through 3 feet of snow, everyday". Our code was tied ever-so-tightly to our hardware platform, and the system code was indistinguishable from the application. While we didn't use an RTOS, we had effectively implemented a 3-priority threading scheme using a carefully designed interrupt nesting scheme with event flags and a while(1) superloop running as a background thread. Nothing was abstracted, and the code was always optimized for the platform, presumably in an effort to save on code size and wasted cycles. I asked why we didn't use an RTOS in any of our systems and received dismissive scoffs - the overhead from thread switching and maintaining multiple threads could not be tolerated in our systems according

to our chief engineers. In retrospect, our ad-hoc system was likely as large as my smallest kernel, and had just as much context switching (although it was hidden by the compiler).

And every time a new iteration of our product was developed, the firmware took far too long to bring up, because the algorithms and data structures had to be re-tooled to work with the peripherals and sensors attached to the new boards. We worked very hard in an attempt to reinvent the wheel, all in the name of producing "efficient" code.

Regardless, I learned a lot about software development.

Most important, I learned that good design is the key to good software; and good design doesn't have to come at a price. In all but the smallest of projects, the well-designed, well-abstracted code is not only more portable, but it's usually smaller, easier to read, and easier to reuse.

Also, since we had all the time in the world to invest in developing our own tools, I gained a lot of experience building them, and making use of good, free PC tools that could be used to develop and debug a large portion of our code. I ended up writing PC-based device and peripheral simulators, state-machine frameworks, and abstractions for our horrible ad-hoc system code. At the end of the day, I had developed enough tools that I could solve a lot of our development problems without having to re-inventing the wheel at each turn. Gaining a background in how these tools worked gave me a better understanding of how to use them - making me more productive at the jobs that I've had since.

I am convinced that designing good software takes honest effort up-front, and that good application code cannot be written unless it is based on a solid framework. Just as the wise man builds his house on rocks, and not on sand, wise developers write applications based on a well-defined platforms. And while you can probably build a house using nothing but a hammer and sheer will, you can certainly build one a lot faster with all the right tools.

This conviction lead me to development my first RTOS kernel in 2009 - FunkOS. It is a small, yet surprisingly full-featured kernel. It has all the basics (semaphores, mutexes, round-robin and preemptive scheduling), and some pretty advanced features as well (device drivers and other middleware). However, it had two major problems - it doesn't scale well, and it doesn't support many devices.

While I had modest success with this kernel (it has been featured on some blogs, and still gets around 125 downloads a month), it was nothing like the success of other RTOS kernels like uC/OS-II and FreeRTOS. To be honest, as a one-man show, I just don't have the resources to support all of the devices, toolchains, and evaluation boards that a real vendor can. I had never expected my kernel to compete with the likes of them, and I don't expect Mark3 to change the embedded landscape either.

My main goal with Mark3 was to solve the technical shortfalls in the FunkOS kernel by applying my experience in kernel development. As a result, Mark3 is better than FunkOS in almost every way; it scales better, has lower interrupt latency, and is generally more thoughtfully designed (all at a small cost to code size).

Another goal I had was to create something easy to understand, that could be documented and serve as a good introduction to RTOS kernel design. The end result of these goals is the kernel as presented in this book - a full source listing of a working OS kernel, with each module completely documented and explained in detail.

Finally, I wanted to prove that a kernel written entirely in C++ could perform just as well as one written in C, without incurring any extra overhead. Comparing the same configuration of Mark2 to Mark3, the code size is remarkably similar, and the execution performance is just as good. Not only that, but there are fewer lines of code. The code is more readable and easier to understand as a result of making use of object-oriented concepts provided by C++. Applications are easier to write because common concepts are encapsulated into objects (Threads, Semaphores, Mutexes, etc.) with their own methods and data, as opposed to APIs which rely on lots of explicit pointer-passing, type casting, and other operations that are typically considered "unsafe" or "advanced topics" in C.

## Chapter 3

# Can you Afford an RTOS?

Of course, since you're reading the manual for an RTOS that I've been developing for the last few years, you can guess that the conclusion that I draw is a resounding "yes".

If your code is of any sort of non-trivial complexity (say, at least a few-thousand lines), then a more appropriate question would be "can you afford *\*not\** to use an RTOS in your system?".

In short, there are simply too many benefits of an RTOS to ignore.

- Sophisticated synchronization objects
- The ability to efficiently block and wait
- Enhanced responsiveness for high-priority tasks
- Built in timers
- Built in efficient memory management

Sure, these features have a cost in code space and RAM, but from my experience the cost of trying to code around a lack of these features will cost you as much - if not more. The results are often far less maintainable, error prone, and complex. And that simply adds time and cost. Real developers ship, and the RTOS is quickly becoming one of the standard tools that help keep developers shipping.

### 3.1 Intro

(Note - this article was written for the C-based Mark2 kernel, which is slightly different. While the general principles are the same, the numbers are not an 100% accurate reflection of the current costs of the Mark3 kernel.)

One of the main arguments against using an RTOS in an embedded project is that the overhead incurred is too great to be justified. Concerns over "wasted" RAM caused by using multiple stacks, added CPU utilization, and the "large" code footprint from the kernel cause a large number of developers to shun using a preemptive RTOS, instead favoring a non-preemptive, application-specific solution.

I believe that not only is the impact negligible in most cases, but that the benefits of writing an application with an RTOS can lead to savings around the board (code size, quality, reliability, and development time). While these other benefits provide the most compelling case for using an RTOS, they are far more challenging to demonstrate in a quantitative way, and are clearly documented in numerous industry-based case studies.

While there is some overhead associated with an RTOS, the typical arguments are largely unfounded when an RTOS is correctly implemented in a system. By measuring the true overhead of a preemptive RTOS in a typical application, we will demonstrate that the impact to code space, RAM, and CPU usage is minimal, and indeed acceptable for a wide range of CPU targets.

To illustrate just how little an RTOS impacts the size of an embedded software design we will look at a typical microcontroller project and analyze the various types of overhead associated with using a pre-emptive realtime kernel versus a similar non-preemptive event-based framework.

RTOS overhead can be broken into three distinct areas:

- Code space: The amount of code space eaten up by the kernel (static)
- Memory overhead: The RAM associated with running the kernel and application threads.
- Runtime overhead: The CPU cycles required for the kernel's functionality (primarily scheduling and thread switching)

While there are other notable reasons to include or avoid the use of an RTOS in certain applications (determinism, responsiveness, and interrupt latency among others), these are not considered in this discussion - as they are difficult to consider for the scope of our "canned" application. Application description:

For the purpose of this comparison, we first create an application using the standard preemptive Mark3 kernel with 2 system threads running: A foreground thread and a background thread. This gives three total priority levels in the system - the interrupt level (high), and two application priority threads (medium and low), which is quite a common paradigm for microcontroller firmware designs. The foreground thread processes a variety of time-critical events at a fixed frequency, while the background thread processes lower priority, aperiodic events. When there are no background thread events to process, the processor enters its low-power mode until the next interrupt is acknowledged.

The contents of the threads themselves are unimportant for this comparison, but we can assume they perform a variety of I/O using various user-input devices and a serial graphics display. As a result, a number of Mark3 device drivers are also implemented.

The application is compiled for an ATmega328p processor which contains 32kB of code space in flash, and 2kB of RAM, which is a lower-mid-range microcontroller in Atmel's 8-bit AVR line of microcontrollers. Using the WinAVR GCC compiler with -O2 level optimizations, an executable is produced with the following code/RAM utilization:

31600 Bytes Code Space 2014 Bytes RAM

An alternate version of this project is created using a custom "super-loop" kernel, which uses a single application thread and provides 2 levels of priority (interrupt and application). In this case, the event handler processes the different priority application events to completion from highest to lowest priority.

This approach leaves the application itself largely unchanged. Using the same optimization levels as the preemptive kernel, the code compiles as follows:

29904 Bytes Code Space 1648 Bytes RAM

## 3.2 Memory overhead:

At first glance, the difference in RAM utilization seems quite a lot higher for the preemptive mode version of the application, but the raw numbers don't tell the whole story.

The first issue is that the cooperative-mode total does not take into account the system stack - whereas these values are included in the totals for RTOS version of the project. As a result, some further analysis is required to determine how the stack sizes truly compare.

In cooperative mode, there is only one thread of execution - so considering that multiple event handlers are executed in turn, the stack requirements for cooperative mode is simply determined by those of the most stack-intensive event handler.

In contrast, the preemptive kernel requires a separate stack for each active thread, and as a result the stack usage of the system is the sum of the stacks for all threads.

Since the application and idle events are the same for both preemptive and cooperative mode, we know that their (independent) stack requirements will be the same in both cases.

For cooperative mode, we see that the idle thread stack utilization is lower than that of the application thread, and so the application thread's determines the stack size requirement. Again, with the preemptive kernel the stack utilization is the sum of the stacks defined for both threads.

As a result, the difference in overhead between the two cases becomes the extra stack required for the idle thread - which in our case is (a somewhat generous) 64 bytes.

The numbers still don't add up completely, but looking into the linker output we see that the rest of the difference comes from the extra data structures used to declare the threads in preemptive mode.

With this taken into account, the true memory cost of a 2-thread system ends up being around 150 bytes of RAM - which is less than 8% of the total memory available on this particular microcontroller. Whether or not this is reasonable certainly depends on the application, but more importantly, it is not so unreasonable as to eliminate an RTOS-based solution from being considered.

### 3.3 Code Space Overhead:

The difference in code space overhead between the preemptive and cooperative mode solutions is less of an issue. Part of this reason is that both the preemptive and cooperative kernels are relatively small, and even an average target device (like the Atmega328 we've chosen) has plenty of room.

Mark3 can be configured so that only features necessary for the application are included in the RTOS - you only pay for the parts of the system that you use. In this way, we can measure the overhead on a feature-by-feature basis, which is shown below for the kernel as configured for this application:

3466 Bytes

The configuration tested in this comparison uses the thread/port module with timers, drivers, and semaphores, for a total kernel size of ~3.5KB, with the rest of the code space occupied by the application.

The custom cooperative-mode framework has a similar structure which is broken down by module as follows:

1850 Bytes

As can be seen from the compiler's output, the difference in code space between the two versions of the application is about 1.7kB - or about 5% of the available code space on the selected processor. While nearly all of this comes from the added overhead of the kernel, the rest of the difference comes the changes to the application necessary to facilitate the different frameworks.

### 3.4 Runtime Overhead

On the cooperative kernel, the overhead associated with running the thread is the time it takes the kernel to notice a pending event flag and launch the appropriate event handler, plus the timer interrupt execution time.

Similarly, on the preemptive kernel, the overhead is the time it takes to switch contexts to the application thread, plus the timer interrupt execution time.

The timer interrupt overhead is similar for both cases, so the overhead then becomes the difference between the following:

Preemptive mode:

- Posting the semaphore that wakes the high-priority thread
- Performing a context switch to the high-priority thread

Cooperative mode:

- Setting the high-priority thread's event flag
- Acknowledging the event from the event loop

Using the cycle-accurate AVR simulator, we find the end-to-end event sequence time to be 20.4us for the cooperative mode scheduler and 44.2us for the preemptive, giving a difference of 23.8us.

With a fixed high-priority event frequency of 33Hz, we achieve a runtime overhead of 983.4us per second, or 0.0983% of the total available CPU time. Now, obviously this value would expand at higher event frequencies and/or slower CPU frequencies, but for this typical application we find the difference in runtime overhead to be negligible for a preemptive system. Analysis:

For the selected test application and platform, including a preemptive RTOS is entirely reasonable, as the costs are low relative to a non-preemptive kernel solution. But these costs scale relative to the speed, memory and code space of the target processor. Because of these variables, there is no "magic bullet" environment suitable for every application, but Mark3 attempts to provide a framework suitable for a wide range of targets.

On the one hand, if these tests had been performed on a higher-end microcontroller such as the ATmega1284p (containing 128kB of code space and 16kB of RAM), the overhead would be in the noise. For this type of resource-rich microcontroller, there would be no reason to avoid using the Mark3 preemptive kernel.

Conversely, using a lower-end microcontroller like an ATmega88pa (which has only 8kB of code space and 1kB of RAM), the added overhead would likely be prohibitive for including a preemptive kernel. In this case, the cooperative-mode kernel would be a better choice.

As a rule of thumb, if one budgets 10% of a microcontroller's code space/RAM for a preemptive kernel's overhead, you should only require at minimum a microcontroller with 16k of code space and 2kB of RAM as a base platform for an RTOS. Unless there are serious constraints on the system that require much better latency or responsiveness than can be achieved with RTOS overhead, almost any modern platform is sufficient for hosting a kernel. In the event you find yourself with a microprocessor with external memory, there should be no reason to avoid using an RTOS at all.

## Chapter 4

# Superloops

### 4.1 Intro to Superloops

Before we start taking a look at designing a real-time operating system, it's worthwhile taking a look through one of the most-common design patterns that developers use to manage task execution in embedded systems - Superloops.

Systems based on superloops favor the system control logic baked directly into the application code, usually under the guise of simplicity, or memory (code and RAM) efficiency. For simple systems, superloops can definitely get the job done. However, they have some serious limitations, and are not suitable for every kind of project. In a lot of cases you can squeak by using superloops - especially in extremely constrained systems, but in general they are not a solid basis for reusable, portable code.

Nonetheless, a variety of examples are presented here- from the extremely simple, to cooperative and limited-preemptive multitasking systems, all of which are examples are representative of real-world systems that I've either written the firmware for, or have seen in my experience.

### 4.2 The simplest loop

Let's start with the simplest embedded system design possible - an infinite loop that performs a single task repeatedly:

```
int main()
{
    while(1)
    {
        Do_Something();
    }
}
```

Here, the code inside the loop will run a single function forever and ever. Not much to it, is there? But you might be surprised at just how much embedded system firmware is implemented using essentially the same mechanism - there isn't anything wrong with that, but it's just not that interesting.

While the execution timeline for this program is equally boring, for the sake of completeness it would look like this:

Despite its simplicity we can see the beginnings of some core OS concepts. Here, the `while(1)` statement can be logically seen as the operating system kernel - this one control statement determines what tasks can run in the system, and defines the constraints that could modify their execution. But at the end of the day, that's a big part of what a kernel is - a mechanism that controls the execution of application code.

The second concept here is the task. This is application code provided by the user to perform some useful purpose in a system. In this case `Do_something()` represents that task - it could be monitoring blood pressure, reading a sensor and writing its data to a terminal, or playing an MP3; anything you can think of for an embedded system to do. A simple round-robin multi-tasking system can be built off of this example by simply adding additional tasks in

sequence in the main while-loop. Note that in this example the CPU is always busy running tasks - at no time is the CPU idle, meaning that it is likely burning a lot of power.

While we conceptually have two separate pieces of code involved here (an operating system kernel and a set of running tasks), they are not logically separate. The OS code is indistinguishable from the application. It's like a single-celled organism - everything is crammed together within the walls of an indivisible unit; and specialized to perform its given function relying solely on instinct.

### 4.3 Interrupt-Driven Super-loop

In the previous example, we had a system without any way to control the execution of the task- it just runs forever. There's no way to control when the task can (or more importantly can't) run, which greatly limits the usefulness of the system. Say you only want your task to run every 100 milliseconds - in the previous code, you have to add a hard-coded delay at the end of your task's execution to ensure your code runs only when it should.

Fortunately, there is a much more elegant way to do this. In this example, we introduce the concept of the synchronization object. A Synchronization object is some data structure which works within the bounds of the operating system to tell tasks when they can run, and in many cases includes special data unique to the synchronization event. There are a whole family of synchronization objects, which we'll get into later. In this example, we make use of the simplest synchronization primitive - the global flag.

With the addition of synchronization brings the addition of event-driven systems. If you're programming a microcontroller system, you generally have scores of peripherals available to you - timers, GPIOs, ADCs, UARTs, ethernet, USB, etc. All of which can be configured to provide a stimulus to your system by means of interrupts. This stimulus gives us the ability not only to program our micros to do\_something(), but to do\_something() if-and-only-if a corresponding trigger has occurred.

The following concepts are shown in the example below:

```
volatile K_BOOL something_to_do = false;

__interrupt__ My_Interrupt_Source(void)
{
    something_to_do = true;
}

int main()
{
    while(1)
    {
        if( something_to_do )
        {
            Do_something();
            something_to_do = false;
        }
        else
        {
            Idle();
        }
    }
}
```

So there you have it - an event driven system which uses a global variable to synchronize the execution of our task based on the occurrence of an interrupt. It's still just a bare-metal, OS-baked-into-the-application system, but it's introduced a whole bunch of added complexity (and control!) into the system.

The first thing to notice in the source is that the global variable, something\_to\_do, is used as a synchronization object. When an interrupt occurs from some external event, triggering the My\_Interrupt\_Source() ISR, program flow in main() is interrupted, the interrupt handler is run, and something\_to\_do is set to true, letting us know that when we get back to main(), that we should run our Do\_something() task.

Another new concept at play here is that of the idle function. In general, when running an event driven system, there are times when the CPU has no application tasks to run. In order to minimize power consumption, CPUs usually contain instructions or registers that can be set up to disable non-essential subsets of the system when there's nothing to do. In general, the sleeping system can be re-activated quickly as a result of an interrupt or other external stimulus, allowing normal processing to resume.

Now, we could just call `Do_something()` from the interrupt itself - but that's generally not a great solution. In general, the more time we spend inside an interrupt, the more time we spend with at least some interrupts disabled. As a result, we end up with interrupt latency. Now, in this system, with only one interrupt source and only one task this might not be a big deal, but say that `Do_something()` takes several seconds to complete, and in that time several other interrupts occur from other sources. While executing in our long-running interrupt, no other interrupts can be processed - in many cases, if two interrupts of the same type occur before the first is processed, one of these interrupt events will be lost. This can be utterly disastrous in a real-time system and should be avoided at all costs. As a result, it's generally preferable to use synchronization objects whenever possible to defer processing outside of the ISR.

Another OS concept that is implicitly introduced in this example is that of task priority. When an interrupt occurs, the normal execution of code in `main()` is preempted: control is swapped over to the ISR (which runs to completion), and then control is given back to `main()` where it left off. The very fact that interrupts take precedence over what's running shows that `main` is conceptually a "low-priority" task, and that all ISRs are "high-priority" tasks. In this example, our "high-priority" task is setting a variable to tell our "low-priority" task that it can do something useful. We will investigate the concept of task priority further in the next example.

Preemption is another key principle in embedded systems. This is the notion that whatever the CPU is doing when an interrupt occurs, it should stop, cache its current state (referred to as its context), and allow the high-priority event to be processed. The context of the previous task is then restored its state before the interrupt, and resumes processing. We'll come back to preemption frequently, since the concept comes up frequently in RTOS-based systems.

## 4.4 Cooperative multi-tasking

Our next example takes the previous example one step further by introducing cooperative multi-tasking:

```
// Bitfield values used to represent three distinct tasks
#define TASK_1_EVENT (0x01)
#define TASK_2_EVENT (0x02)
#define TASK_3_EVENT (0x04)

volatile K_UCHAR event_flags = 0;

// Interrupt sources used to trigger event execution

__interrupt__ My_Interrupt_1(void)
{
    event_flags |= TASK_1_EVENT;
}

__interrupt__ My_Interrupt_2(void)
{
    event_flags |= TASK_2_EVENT;
}

__interrupt__ My_Interrupt_3(void)
{
    event_flags |= TASK_3_EVENT;
}

// Main tasks
int main(void)
{
    while(1)
    {
        while(event_flags)
        {
            if( event_flags & TASK_1_EVENT)
            {
                Do_Task_1();
                event_flags &= ~TASK_1_EVENT;
            } else if( event_flags & TASK_2_EVENT) {
                Do_Task_2();
                event_flags &= ~TASK_2_EVENT;
            } else if( event_flags & TASK_3_EVENT) {
                Do_Task_3();
                event_flags &= ~TASK_3_EVENT;
            }
        }
        Idle();
    }
}
```

This system is very similar to what we had before - however the differences are worth discussing. First, we have stimulus from multiple interrupt sources: each ISR is responsible for setting a single bit in our global event flag, which is then used to control execution of individual tasks from within main().

Next, we can see that tasks are explicitly given priorities inside the main loop based on the logic of the if/else if structure. As long as there is something set in the event flag, we will always try to execute Task1 first, and only when Task1 isn't set will we attempt to execute Task2, and then Task 3. This added logic provides the notion of priority. However, because each of these tasks exist within the same context (they're just different functions called from our main control loop), we don't have the same notion of preemption that we have when dealing with interrupts.

That means that even through we may be running Task2 and an event flag for Task1 is set by an interrupt, the CPU still has to finish processing Task2 to completion before Task1 can be run. And that's why this kind of scheduling is referred to ascooperative multitasking: we can have as many tasks as we want, but unless they cooperate by means of returning back to main, the system can end up with high-priority tasks getting starved for CPU time by lower-priority, long-running tasks.

This is one of the more popular Os-baked-into-the-application approaches, and is widely used in a variety of real-time embedded systems.

## 4.5 Hybrid cooperative/preemptive multi-tasking

The final variation on the superloop design utilizes software-triggered interrupts to simulate a hybrid cooperative/preemptive multitasking system. Consider the example code below.

```
// Bitfields used to represent high-priority tasks. Tasks in this group
// can preempt tasks in the group below - but not eachother.
#define HP_TASK_1      (0x01)
#define HP_TASK_2      (0x02)

volatile K_UCHAR hp_tasks = 0;

// Bitfields used to represent low-priority tasks.
#define LP_TASK_1      (0x01)
#define LP_TASK_2      (0x02)

volatile K_UCHAR lp_tasks = 0;

// Interrupt sources, used to trigger both high and low priority tasks.
__interrupt__ System_Interrupt_1(void)
{
    // Set any of the other tasks from here...
    hp_tasks |= HP_TASK_1;
    // Trigger the SWI that calls the High_Priority_Tasks interrupt handler
    SWI();
}

__interrupt__ System_Interrupt_n...(void)
{
    // Set any of the other tasks from here...
}

// Interrupt handler that is used to implement the high-priority event context
__interrupt__ High_Priority_Tasks(void)
{
    // Enabled every interrupt except this one
    Disable_My_Interrupt();
    Enable_Interrupts();
    while( hp_tasks)
    {
        if( hp_tasks & HP_TASK_1)
        {
            HP_Task1();
            hp_tasks &= ~HP_TASK_1;
        }
        else if (hp_tasks & HP_TASK_2)
        {
            HP_Task2();
            hp_tasks &= ~HP_TASK_2;
        }
    }
    Restore_Interrupts();
    Enable_My_Interrupt();
}
```

```
// Main loop, used to implement the low-priority events
int main(void)
{
    // Set the function to run when a SWI is triggered
    Set_SWI(High_Priority_Tasks);

    // Run our super-loop
    while(1)
    {
        while (lp_tasks)
        {
            if (lp_tasks & LP_TASK_1)
            {
                LP_Task1();
                lp_tasks &= ~LP_TASK_1;
            }
            else if (lp_tasks & LP_TASK_2)
            {
                LP_Task2();
                lp_tasks &= ~LP_TASK_2;
            }
        }
        Idle();
    }
}
```

In this example, `High_Priority_Tasks()` can be triggered at any time as a result of a software interrupt (SWI). When a high-priority event is set, the code that sets the event calls the SWI as well, which instantly preempts whatever is happening in main, switching to the high-priority interrupt handler. If the CPU is executing in an interrupt handler already, the current ISR completes, at which point control is given to the high priority interrupt handler.

Once inside the HP ISR, all interrupts (except the software interrupt) are re-enabled, which allows this interrupt to be preempted by other interrupt sources, which is called interrupt nesting. As a result, we end up with two distinct execution contexts (main and `HighPriorityTasks()`), in which all tasks in the high-priority group are guaranteed to preempt main() tasks, and will run to completion before returning control back to tasks in main(). This is a very basic preemptive multitasking scenario, approximating a "real" RTOS system with two threads of different priorities.

## 4.6 Problems with superloops

As mentioned earlier, a lot of real-world systems are implemented using a superloop design; and while they are simple to understand due to the limited and obvious control logic involved, they are not without their problems.

### Hidden Costs

It's difficult to calculate the overhead of the superloop and the code required to implement workarounds for blocking calls, scheduling, and preemption. There's a cost in both the logic used to implement workarounds (usually involving state machines), as well as a cost to maintainability that comes with breaking up into chunks based on execution time instead of logical operations. In moderate firmware systems, this size cost can exceed the overhead of a reasonably well-featured RTOS, and the deficit in maintainability is something that is measurable in terms of lost productivity through debugging and profiling.

### Tightly-coupled code

Because the control logic is integrated so closely with the application logic, a lot of care must be taken not to compromise the separation between application and system code. The timing loops, state machines, and architecture-specific control mechanisms used to avoid (or simulate) preemption can all contribute to the problem. As a result, a lot of superloop code ends up being difficult to port without effectively simulating or replicating the underlying system for which the application was written. Abstraction layers can mitigate the risks, but a lot of care should be taken to fully decouple the application code from the system code.

### No blocking calls

In a super-loop environment, there's no such thing as a blocking call or blocking objects. Tasks cannot stop mid-execution for event-driven I/O from other contexts - they must always run to completion. If busy-waiting and polling are used as a substitute, it increases latency and wastes cycles. As a result, extra code complexity is often times necessary to work-around this lack of blocking objects, often times through implementing additional state machines. In a large enough system, the added overhead in code size and cycles can add up.

### Difficult to guarantee responsiveness

Without multiple levels of priority, it may be difficult to guarantee a certain degree of real-time responsiveness without added profiling and tweaking. The latency of a given task in a priority-based cooperative multitasking system is the length of the longest task. Care must be taken to break tasks up into appropriate sized chunks in order to ensure that higher-priority tasks can run in a timely fashion - a manual process that must be repeated as new tasks are added in the system. Once again, this adds extra complexity that makes code larger, more difficult to understand and maintain due to the artificial subdivision of tasks into time-based components.

**Limited preemption capability**

As shown in the example code, the way to gain preemption in a superloop is through the use of nested interrupts. While this isn't unwieldy for two levels of priority, adding more levels beyond this becomes complicated. In this case, it becomes necessary to track interrupt nesting manually, and separate sets of tasks that can run within given priority loops - and deadlock becomes more difficult to avoid.

## Chapter 5

# Mark3 Overview

### 5.1 Intro

The following section details the overall design of Mark3, the goals I've set out to achieve, the features that I've intended to provide, as well as an introduction to the programming concepts used to make it happen.

### 5.2 Features

Mark3 is a fully-featured real-time kernel, and is feature-competitive with other open-source and commercial RTOS's in the embedded arena.

The key features of this RTOS are:

- Flexible [Scheduler](#)
  - Unlimited number of threads with 8 priority levels
  - Unlimited threads per priority level
  - Round-robin scheduling for threads at each priority level
  - Time quantum scheduling for each thread in a given priority level
- Configurable stacks for each [Thread](#)
- Resource protection:
  - Integrated mutual-exclusion semaphores ([Mutex](#))
  - Priority-inheritance on [Mutex](#) objects to prevent priority inversion
- Synchronization Objects
  - Binary and counting [Semaphore](#) to coordinate thread execution
  - Event flags with 16-bit bitfields for complex thread synchronization
- Efficient Timers
  - The RTOS is tickless, the OS only wakes up when a timer expires, not at a regular interval
  - One-shot and periodic timers with event callbacks
  - Timers are high-precision and long-counting (about 68000 seconds when used with a 16us resolution timer)
- [Driver](#) API
  - A hardware abstraction layer is provided to simplify driver development
- Robust Interprocess Communications
  - Threadsafe global [Message](#) pool and configurable message queues

## 5.3 Design Goals

### Lightweight

Mark3 can be configured to have an extremely low static memory footprint. Each thread is defined with its own stack, and each thread structure can be configured to take as little as 26 bytes of RAM. The complete Mark3 kernel with all features, setup code, a serial driver, and the Mark3 protocol libraries comes in at under 9K of code space and 1K of RAM on atmel AVR.

### Modular

Each system feature can be enabled or disabled by modifying the kernel configuration header file. Include what you want, and ignore the rest to save code space and RAM.

### Easily Portable

Mark3 should be portable to a variety of 8, 16 and 32 bit architectures without MMUs. Porting the OS to a new architecture is relatively straightforward, requiring only device-specific implementations for the lowest-level operations such as context switching and timer setup.

### Easy To Use

Mark3 is small by design - which gives it the advantage that it's also easy to develop for. This manual, the code itself, and the Doxygen documentation in the code provide ample documentation to get you up to speed quickly. Because you get to see the source, there's nothing left to assumption.

### Simple to Understand

Not only is the Mark3 API rigorously documented (hey - that's what this book is for!), but the architecture and naming conventions are intuitive - it's easy to figure out where code lives, and how it works. Individual modules are small due to the "one feature per file" rule used in development. This makes Mark3 an ideal platform for learning about aspects of RTOS design.

## Chapter 6

# Getting Started

### 6.1 Kernel Setup

This section details the process of defining threads, initializing the kernel, and adding threads to the scheduler.

If you're at all familiar with real-time operating systems, then these setup and initialization steps should be familiar. I've tried very hard to ensure that as much of the heavy lifting is hidden from the user, so that only the bare minimum of calls are required to get things started.

The examples presented in this chapter are real, working examples taken from the ATmega328p port.

First, you'll need to create the necessary data structures and functions for the threads:

1. Create a [Thread](#) object for all of the "root" or "initial" tasks.
2. Allocate stacks for each of the Threads
3. Define an entry-point function for each [Thread](#)

This is shown in the example code below:

```
//-----
#include "thread.h"
#include "kernel.h"

//1) Create a thread object for all of the "root" or "initial" tasks
static Thread AppThread;
static Thread IdleThread;

//2) Allocate stacks for each thread
#define STACK_SIZE_APP      (192)
#define STACK_SIZE_IDLE     (128)

static K_UCHAR aucAppStack[STACK_SIZE_APP];
static K_UCHAR aucIdleStack[STACK_SIZE_IDLE];

//3) Define entry point functions for each thread
void AppThread(void);
void IdleThread(void);
```

Next, we'll need to add the required kernel initialization code to main. This consists of running the [Kernel's](#) init routine, initializing all of the threads we defined, adding the threads to the scheduler, and finally calling [Kernel::Start\(\)](#), which transfers control of the system to the RTOS.

These steps are illustrated in the following example.

```
int main(void)
{
    //1) Initialize the kernel prior to use
    Kernel::Init();

    //2) Initialize all of the threads we've defined
```

```

AppThread.Init(    aucAppStack,
                  STACK_SIZE_APP,
                  1,
                  (void*)AppEntry,
                  NULL );

IdleThread.Init(  aucIdleStack,
                  STACK_SIZE_IDLE,
                  0,
                  4,
                  (void*)IdleEntry,
                  NULL );

//3) Add the threads to the scheduler
AppThread.Start();
IdleThread.Start();

//4) Give control of the system to the kernel
Kernel::Start();
}

```

Not much to it, is there? There are a few noteworthy points in this code, though.

In order for the kernel to work properly, a system must always contain an idle thread; that is, a thread at priority level 0 that never blocks. This thread is responsible for performing any of the low-level power management on the CPU in order to maximize battery life in an embedded device. The idle thread must also never block, and it must never exit. Either of these operations will cause undefined behavior in the system.

The App thread is at a priority level greater-than 0. This ensures that as long as the App thread has something useful to do, it will be given control of the CPU. In this case, if the app thread blocks, control will be given back to the Idle thread, which will put the CPU into a power-saving mode until an interrupt occurs.

Stack sizes must be large enough to accommodate not only the requirements of the threads, but also the requirements of interrupts - up to the maximum interrupt-nesting level used. Stack overflows are super-easy to run into in an embedded system; if you encounter strange and unexplained behavior in your code, chances are good that one of your threads is blowing its stack.

## 6.2 Threads

Mark3 Threads act as independent tasks in the system. While they share the same address-space, global data, device-drivers, and system peripherals, each thread has its own set of CPU registers and stack, collectively known as the thread's **context**. The context is what allows the RTOS kernel to rapidly switch between threads at a high rate, giving the illusion that multiple things are happening in a system, when really, only one thread is executing at a time.

### 6.2.1 Thread Setup

Each instance of the [Thread](#) class represents a thread, its stack, its CPU context, and all of the state and metadata maintained by the kernel. Before a [Thread](#) will be scheduled to run, it must first be initialized with the necessary configuration data.

The Init function gives the user the opportunity to set the stack, stack size, thread priority, entry-point function, entry-function argument, and round-robin time quantum:

[Thread](#) stacks are pointers to blobs of memory (usually K\_CHAR arrays) carved out of the system's address space. Each thread must have a stack defined that's large enough to handle not only the requirements of local variables in the thread's code path, but also the maximum depth of the ISR stack.

Priorities should be chosen carefully such that the shortest tasks with the most strict determinism requirements are executed first - and are thus located in the highest priorities. Tasks that take the longest to execute (and require the least degree of responsiveness) must occupy the lower thread priorities. The idle thread must be the only thread occupying the lowest priority level.

The thread quantum only applies when there are multiple threads in the ready queue at the same priority level. This interval is used to kick-off a timer that will cycle execution between the threads in the priority list so that they each get a fair chance to execute.

The entry function is the function that the kernel calls first when the thread instance is first started. Entry functions have at most one argument - a pointer to a data-object specified by the user during initialization.

An example thread initialization is shown below:

```
Thread clMyThread;
K_UCHAR aucStack[192];

void AppEntry(void)
{
    while(1)
    {
        // Do something!
    }
}

...
{
    clMyThread.Init(aucStack,
                    192,
                    1,
                    4,
                    (void*)AppEntry,
                    NULL );
}
```

Once a thread has been initialized, it can be added to the scheduler by calling:

```
clMyThread.Start();
```

The thread will be placed into the [Scheduler's](#) queue at the designated priority, where it will wait its turn for execution.

## 6.2.2 Entry Functions

Mark3 Threads should not run-to-completion - they should execute as infinite loops that perform a series of tasks, appropriately partitioned to provide the responsiveness characteristics desired in the system.

The most basic [Thread](#) loop is shown below:

```
void Thread( void *param )
{
    while(1)
    {
        // Do Something
    }
}
```

Threads can interact with eachother in the system by means of synchronization objects ([Semaphore](#)), mutual-exclusion objects ([Mutex](#)), Inter-process messaging ([MessageQueue](#)), and timers ([Timer](#)).

Threads can suspend their own execution for a predetermined period of time by using the static [Thread::Sleep\(\)](#) method. Calling this will block the [Thread's](#) executin until the amount of time specified has ellapsed. Upon expiry, the thread will be placed back into the ready queue for its priority level, where it awaits its next turn to run.

## 6.3 Timers

[Timer](#) objects are used to trigger callback events periodic or on a one-shot (alarm) basis.

While extremely simple to use, they provide one of the most powerful execution contexts in the system. The timer callbacks execute from within the timer callback ISR in an interrupt-enabled context. As such, timer callbacks are considered higher-priority than any thread in the system, but lower priority than other interrupts. Care must be taken to ensure that timer callbacks execute as quickly as possible to minimize the impact of processing on the throughput of tasks in the system. Wherever possible, heavy-lifting should be deferred to the threads by way of semaphores or messages.

Below is an example showing how to start a periodic system timer which will trigger every second:

```

{
    Timer clTimer;
    clTimer.Init();

    clTimer.Start( 1000,
                  1,
                  MyCallback,
                  (void*)&my_data );

    ... // Keep doing work in the thread
}

// Callback function, executed from the timer-expiry context.
void MyCallback( Thread *pclOwner_, void *pvData_ )
{
    LED.Flash(); // Flash an LED.
}

```

## 6.4 Semaphores

Semaphores are used to synchronized execution of threads based on the availability (and quantity) of application-specific resources in the system. They are extremely useful for solving producer-consumer problems, and are the method-of-choice for creating efficient, low latency systems, where ISRs post semaphores that are handled from within the context of individual threads. (Yes, Semaphores can be posted - but not pended - from the interrupt context).

The following is an example of the producer-consumer usage of a binary semaphore:

```

Semaphore clSemaphore; // Declare a semaphore shared between a producer and a consumer thread.

void Producer()
{
    clSemaphore.Init(0, 1);
    while(1)
    {
        // Do some work, create something to be consumed

        // Post a semaphore, allowing another thread to consume the data
        clSemaphore.Post();
    }
}

void Consumer()
{
    // Assumes semaphore initialized before use...
    While(1)
    {
        // Wait for new data from the producer thread
        clSemaphore.Pend();

        // Consume the data!
    }
}

```

And an example of using semaphores from the ISR context to perform event- driven processing.

```

Semaphore clSemaphore;

__interrupt__ MyISR()
{
    clSemaphore.Post(); // Post the interrupt. Lightweight when uncontested.
}

void MyThread()
{
    clSemaphore.Init(0, 1); // Ensure this is initialized before the MyISR interrupt is enabled.
    while(1)
    {
        // Wait until we get notification from the interrupt
        clSemaphore.Pend();

        // Interrupt has fired, do the necessary work in this thread's context
        HeavyLifting();
    }
}

```

## 6.5 Mutexes

Mutexes (Mutual exclusion objects) are provided as a means of creating "protected sections" around a particular resource, allowing for access of these objects to be serialized. Only one thread can hold the mutex at a time - other threads have to wait until the region is released by the owner thread before they can take their turn operating on the protected resource. Note that mutexes can only be owned by threads - they are not available to other contexts (i.e. interrupts). Calling the mutex APIs from an interrupt will cause catastrophic system failures.

Note that these objects are also not recursive- that is, the owner thread can not attempt to claim a mutex more than once.

Priority inheritance is provided with these objects as a means to avoid priority inversions. Whenever a thread at a priority than the mutex owner blocks on a mutex, the priority of the current thread is boosted to the highest-priority waiter to ensure that other tasks at intermediate priorities cannot artificially prevent progress from being made.

**Mutex** objects are very easy to use, as there are only three operations supported: Initialize, Claim and Release. An example is shown below.

```

Mutex clMutex;    // Create a mutex globally.

void Init()
{
    // Initialize the mutex before use.
    clMutex.Init();
}

// Some function called from a thread
void Thread1Function()
{
    clMutex.Claim();

    // Once the mutex is owned, no other thread can
    // enter a block protect by the same mutex

    my_protected_resource.do_something();
    my_protected_resource.do_something_else();

    clMutex.Release();
}

// Some function called from another thread
void Thread2Function()
{
    clMutex.Claim();

    // Once the mutex is owned, no other thread can
    // enter a block protect by the same mutex

    my_protected_resource.do_something();
    my_protected_resource.do_different_things();

    clMutex.Release();
}

```

## 6.6 Event Flags

Event Flags are another synchronization object, conceptually similar to a semaphore.

Unlike a semaphore, however, the condition on which threads are unblocked is determined by a more complex set of rules. Each Event Flag object contains a 16-bit field, and threads block, waiting for combinations of bits within this field to become set.

A thread can wait on any pattern of bits from this field to be set, and any number of threads can wait on any number of different patterns. Threads can wait on a single bit, multiple bits, or bits from within a subset of bits within the field.

As a result, setting a single value in the flag can result in any number of threads becoming unblocked simultaneously. This mechanism is extremely powerful, allowing for all sorts of complex, yet efficient, thread synchronization schemes that can be created using a single shared object.

Note that Event Flags can be set from interrupts, but you cannot wait on an event flag from within an interrupt.

Examples demonstrating the use of event flags are shown below.

```
// Simple example showing a thread blocking on a multiple bits in the
// fields within an event flag.

EventFlag clEventFlag;

int main()
{
    ...
    clEventFlag.Init(); // Initialize event flag prior to use
    ...
}

void MyInterrupt()
{
    // Some interrupt corresponds to event 0x0020
    clEventFlag.Set(0x0020);
}

void MyThreadFunc()
{
    ...
    while(1)
    {
        ...
        K_USHORT usWakeCondition;

        // Allow this thread to block on multiple flags
        usWakeCondition = clEventFlag.Wait(0x00FF, EVENT_FLAG_ANY);

        // Clear the event condition that caused the thread to wake (in this case,
        // usWakeCondition will equal 0x20 when triggered from the interrupt above)
        clEventFlag.Clear(usWakeCondition);

        // <do something>
    }
}
```

## 6.7 Messages

Sending messages between threads is the key means of synchronizing access to data, and the primary mechanism to perform asynchronous data processing operations.

Sending a message consists of the following operations:

- Obtain a [Message](#) object from the global message pool
- Set the message data and event fields
- Send the message to the destination message queue

While receiving a message consists of the following steps:

- Wait for a messages in the destination message queue
- Process the message data
- Return the message back to the global message pool

These operations, and the various data objects involved are discussed in more detail in the following section.

### 6.7.1 Message Objects

[Message](#) objects are used to communicate arbitrary data between threads in a safe and synchronous way.

The message object consists of an event code field and a data field. The event code is used to provide context to the message object, while the data field (essentially a void \* data pointer) is used to provide a payload of data corresponding to the particular event.

Access to these fields is marshalled by accessors - the transmitting thread uses the `SetData()` and `SetCode()` methods to seed the data, while the receiving thread uses the `GetData()` and `GetCode()` methods to retrieve it.

By providing the data as a void data pointer instead of a fixed-size message, we achieve an unprecedented measure of simplicity and flexibility. Data can be either statically or dynamically allocated, and sized appropriately for the event without having to format and reformat data by both sending and receiving threads. The choices here are left to the user - and the kernel doesn't get in the way of efficiency.

It is worth noting that you can send messages to message queues from within ISR context. This helps maintain consistency, since the same APIs can be used to provide event-driven programming facilities throughout the whole of the OS.

### 6.7.2 Global Message Pool

To maintain efficiency in the messaging system (and to prevent over-allocation of data), a global pool of message objects is provided. The size of this message pool is specified in the implementation, and can be adjusted depending on the requirements of the target application as a compile-time option.

Allocating a message from the message pool is as simple as calling the `GlobalMessagePool::Pop()` Method.

Messages are returned back to the `GlobalMessagePool::Push()` method once the message contents are no longer required.

One must be careful to ensure that discarded messages always are returned to the pool, otherwise a resource leak can occur, which may cripple the operating system's ability to pass data between threads.

### 6.7.3 Message Queues

`Message` objects specify data with context, but do not specify where the messages will be sent. For this purpose we have a `MessageQueue` object. Sending an object to a message queue involves calling the `MessageQueue::Send()` method, passing in a pointer to the `Message` object as an argument.

When a message is sent to the queue, the first thread blocked on the queue (as a result of calling the `MessageQueue::Receive()` method) will wake up, with a pointer to the `Message` object returned.

It's worth noting that multiple threads can block on the same message queue, providing a means for multiple threads to share work in parallel.

### 6.7.4 Messaging Example

```
// Message queue object shared between threads
MessageQueue cMsgQ;

// Function that initializes the shared message queue
void MsgQInit()
{
    cMsgQ.Init();
}

// Function called by one thread to send message data to
// another
void TxMessage()
{
    // Get a message, initialize its data
    Message *pclMsg = GlobalMessagePool::Pop();

    pclMsg->SetCode(0xAB);
    pclMsg->SetData((void*)some_data);

    // Send the data to the message queue
    cMsgQ.Send(pclMsg);
}

// Function called in the other thread to block until
// a message is received in the message queue.
void RxMessage()
{
    Message *pclMsg;
```

```

// Block until we have a message in the queue
pclMsg = clMsgQ.Receive();

// Do something with the data once the message is received
pclMsg->GetCode();

// Free the message once we're done with it.
GlobalMessagePool::Push(pclMsg);
}

```

## 6.8 Sleep

There are instances where it may be necessary for a thread to poll a resource, or wait a specific amount of time before proceeding to operate on a peripheral or volatile piece of data.

While the [Timer](#) object is generally a better choice for performing time-sensitive operations (and certainly a better choice for periodic operations), the [Thread::Sleep\(\)](#) method provides a convenient (and efficient) mechanism that allows for a thread to suspend its execution for a specified interval.

Note that when a thread is sleeping it is blocked, during which other threads can operate, or the system can enter its idle state.

```

int GetPeripheralData();
{
    int value;
    // The hardware manual for a peripheral specifies that
    // the "foo()" method will result in data being generated
    // that can be captured using the "bar()" method.
    // However, the value only becomes valid after 10ms

    peripheral.foo();
    Thread::Sleep(10);    // Wait 10ms for data to become valid
    value = peripheral.bar();
    return value;
}

```

## 6.9 Round-Robin Quantum

Threads at the same thread priority are scheduled using a round-robin scheme. Each thread is given a timeslice (which can be configured) of which it shares time amongst ready threads in the group. Once a thread's timeslice has expired, the next thread in the priority group is chosen to run until its quantum has expired - the cycle continues over and over so long as each thread has work to be done.

By default, the round-robin interval is set at 4ms.

This value can be overridden by calling the thread's [SetQuantum\(\)](#) with a new interval specified in milliseconds.

## Chapter 7

# Inside The Scheduler

This section details the inner-working of the Mark3 [Scheduler](#) in detail.

### 7.1 A Bit About Threads

Before we get started talking about the internals of the Mark3 scheduler, it's necessary to go over some background material - starting with: what is a thread, anyway?

Let's look at a very basic CPU without any sort of RTOS, and without interrupts. When the CPU is powered up, the program counter is loaded with some default location, at which point the processor core will start executing instructions sequentially - running forever and ever according to whatever has been loaded into program memory. This single instance of a simple program sequence is the only thing that runs on the processor, and the execution of the program can be predicted entirely by looking at the CPU's current register state, its program, and any affected system memory (the CPU's "context").

It's simple enough, and that's exactly the definition we have for a thread in an RTOS.

Each thread contains an instance of a CPU's register context, its own stack, and any other bookkeeping information necessary to define the minimum unique execution state of a system at runtime. It is the job of a RTOS to multiplex the execution of multiple threads on a single physical CPU, thereby creating the illusion that many programs are being executed simultaneously. In reality there can only ever be one thread truly executing at any given moment on a CPU core, so it's up to the scheduler to set and enforce rules about what thread gets to run when, for how long, and under what conditions. As mentioned earlier, any system without an RTOS executes as a single thread, so at least two threads are required for an RTOS to serve any useful purpose.

Note that all of this information is common to pretty well every RTOS in existence - the implementation details, including the scheduler rules, are all part of what differentiates one RTOS from another.

### 7.2 Thread States and Thread Lists

Since only one thread can run on a CPU at a time, the scheduler relies on thread information to make its decisions. Mark3's scheduler relies on a variety of such information, including: The thread's current priority Round-Robin execution quanta Whether or not the thread is blocked on a synchronization object, such as a mutex or semaphore Whether or not the thread is currently suspended The scheduler further uses this information to logically place each thread into 1 of 4 possible states: Ready - The thread is currently running Running - The thread is able to run Blocked - The thread cannot run until a system condition is met Stopped - The thread cannot run because its execution has been suspended In order to determine a thread's state, threads are placed in "buckets" corresponding to these states. Ready and running threads exist in the scheduler's buckets, blocked threads exist in a buckets belonging to the object they're blocked on, and stopped threads exist in a bucket of all stopped threads.

In reality, the various buckets are just doubly-linked lists of [Thread](#) objects

- implemented in something called the [ThreadList](#) class. To facilitate this, the [Thread](#) class directly inherits

from the [LinkedListNode](#) class, which contains the node pointers required to implement a doubly-linked list. As a result, Threads may be effortlessly moved from one state to another using efficient linked-list operations built into the [ThreadList](#) class.

## 7.3 About Blocking and Unblocking

While many developers new to the concept of an RTOS assume that all threads in a system are entirely separate from each other, the reality is that practical systems typically involve multiple threads working together, or at the very least sharing resources. In order to synchronize the execution of threads for that purpose, a number of synchronization primitives (blocking objects) are implemented to create specific sets of conditions under which threads can continue execution. The concept of "blocking" a thread until a specific condition is met is fundamental to understanding RTOS applications design, as well as any highly-multithreaded applications.

Blocking objects and primitives provided by Mark3 include:

- Semaphores (binary and counting)
- Mutexes
- Event Flags
- [Thread](#) Sleep
- [Message](#) Queues

Each of these objects inherit from the [BlockingObject](#) class, which itself contains a [ThreadList](#) object. This class contains methods to `Block()` a thread (remove it from the [Scheduler](#)'s "Ready" or "Running" ThreadLists), as well as `UnBlock()` a thread (move a thread back to the "Ready" lists). This object handles transitioning threads from list-to-list (and state-to-state), as well as taking care of any other [Scheduler](#) bookkeeping required in the process. While each of the Blocking types implement a different condition, they are effectively variations on the same theme. Many simple Blocking objects are also used to build complex blocking objects - for instance, the [Thread](#) Sleep mechanism is essentially a binary semaphore and a timer object, while a message queue is a linked-list of message objects combined with a semaphore.

## 7.4 The Scheduling Algorithm

At this point we've covered the following concepts:

- Threads
- [Thread](#) States and [Thread](#) Lists
- Blocking and Un-Blocking Threads

Thankfully, this is all the background required to understand how the Mark3 [Scheduler](#) works. In technical terms, Mark3 implements "strict priority scheduling, with round-robin scheduling among threads in each priority group". In plain English, this boils down to a scheduler which follows a few simple rules:

- Find the highest-priority "Ready" list that has at least one Threads.
- If the first thread in that bucket is not the current thread, select it to run next
- Otherwise, rotate the linked list, and choose the next thread in the list to run

Since context switching is one of the most common and frequent operation performed by an RTOS, this needs to be as fast and deterministic as possible. While the logic is simple, a lot of care must be put into optimizing the scheduler to achieve those goals. In the section below we discuss the optimization approaches taken in Mark3.

There are a number of ways to find the highest-priority thread. The naive approach would be to simply iterate through the scheduler's array of ThreadLists from highest to lowest, stopping when the first non-empty list is found, such as in the following block of code:

```
for (prio = num_prio - 1; prio >= 0; prio--)
{
    if (thread_list[prio].get_head() != NULL)
    {
        break;
    }
}
```

While that would certainly work and be sufficient for a variety of systems, it's a non-deterministic approach (complexity  $O(n)$ ) whose cost varies substantially based on how many priorities have to be evaluated. It's simple to read and understand, but it's non-optimal.

Fortunately, a functionally-equivalent and more deterministic approach can be implemented with a few tricks.

In addition to maintaining an array of ThreadLists, Mark3 also maintains a bitmap (one bit per priority level) that indicates which thread lists have ready threads. This bitmap is maintained automatically by the [ThreadList](#) class, and is updated every time a thread is moved to/from the [Scheduler's](#) ready lists.

By inspecting this bitmap using a technique to count the leading zero bits in the bitmap, we determine which threadlist to choose in fixed time.

Now, to implement the leading-zeros check, this can once again be performed iteratively using bitshifts and compares (which isn't any more efficient than the raw list traversal), but it can also be evaluated using either a lookup table, or via a special CPU instruction to count the leading zeros in a value. In Mark3, we opt for the lookup-table approach since we have a limited number of priorities and not all supported CPU architectures support a count leading zero instruction. To achieve a balance between performance and memory use, we use a 4-bit lookup table (costing 16 bytes) to perform the lookup.

(As a sidenote - this is actually a very common approach in OS schedulers. It's actually part of the reason why modern ARM cores implement a dedicated count-leading-zeros [CLZ] instruction!)

With a 4-bit lookup table and an 8-bit priority-level bitmap, the priority check algorithm looks something like this:

```
// Check the highest 4 priority levels, represented in the
// upper 4 bits in the bitmap
priority = priority_lookup_table[(priority_bitmap >> 4)];

// priority is non-zero if we found something there
if( priority )
{
    // Add 4 because we were looking at the higher levels
    priority += 4;
}
else
{
    // Nothing in the upper 4, look at the lowest 4 priority levels
    // represented by the lowest 4 bits in the bitmap
    priority = priority_lookup_table[priority_bitmap & 0x0F];
}
```

Deconstructing this algorithm, you can see that the priority lookup will have an  $O(1)$  complexity - and is extremely low-cost. This operation is thus fully deterministic and time bound - no matter how many threads are scheduled, the operation will always be time-bound to the most expensive of these two code paths. Even with only 8 priority levels, this is still much faster than iteratively checking the thread lists manually, compared with the previous example implementation.

Once the priority level has been found, selecting the next thread to run is trivial, consisting of something like this:

```
next_thread = thread_list[prio].get_head();
```

In the case of the `get_head()` calls, this evaluates to an inline-load of the "head" pointer in the particular thread list. One important thing to take away from this analysis is that the scheduler is only responsible for selecting the next-to-run thread. In fact, these two operations are totally decoupled - no context switching is performed by the scheduler, and the scheduler isn't called from the context switch. The scheduler simply produces new "next thread" values that are consumed from within the context switch code.

## 7.5 Considerations For Round-Robin Scheduling

One thing that isn't considered directly from the scheduler algorithm is the problem of dealing with multiple threads within a single priority group; all of the algorithms that have been explored above simply look at the firstThread in each group.

Mark3 addresses this issue indirectly, using a software timer to manage round-robin scheduling, as follows. In some instances where the scheduler is run by the kernel directly (typically as a result of calling `Thread::Yield()`), the kernel will perform an additional check after running the `Scheduler` to determine whether or there are multiple ready Threads in the priority of the next ready thread. If there are multiple threads within that priority, the kernel adds a one-shot software timer which is programmed to expire at the next `Thread`'s configured quantum. When this timer expires, the timer's callback function executes to perform two simple operations: "Pivot" the current `Thread`'s priority list.

Set a flag telling the kernel to trigger a Yield after exiting the main `TimerScheduler` processing loop. Pivoting the thread list basically moves the head of a circular-linked-list to its next value, which in our case ensures that a new thread will be chosen the next time the scheduler is run (the scheduler only looks at the head node of the priority lists). And by calling `Yield`, the system forces the scheduler to run, a new round-robin software timer to be installed (if necessary), and triggers a context switch SWI to load the newly-chosen thread. Note that if the thread attached to the round-robin timer is pre-empted, the kernel will take steps to abort and invalidate that round-robin software timer, installing a new one tied to the next thread to run if necessary. Because the round-robin software timer is dynamically installed when there are multiple ready threads at the highest ready priority level, there is no CPU overhead with this feature unless that condition is met. The cost of round-robin scheduling is also fixed - no matter how many threads there are, and the cost is identical to any other one-shot software timer in the system.

## 7.6 Context Switching

There's really not much to say about the actual context switch operation at a high level. Context switches are triggered whenever it has been determined that a new thread needs to be swapped into the CPU core when the scheduler is run. Mark3 implements also context switches as a call to a software interrupt - on AVR platforms, we typically use INT0 or INT2 for this (although any pin-change GPIO interrupt can be used), and on ARM we achieve this by triggering a PendSV exception.

However, regardless of the architecture, the context-switch ISR will perform the following three operations:

- Save the current `Thread`'s context to the current `Thread` stack
- Make the "next to run" thread the "currently running" thread
- Restore the context of the next `Thread` from the `Thread` stack

The code to implement the context switch is entirely architecture-specific, so it won't be discussed in detail here. It's almost always gory inline-assembly which is used to load and store various CPU registers, and is highly-optimized for speed. I will dive into how this important bit of code works (on ARM Cortex-M0+) in a separate whitepaper.

## 7.7 Putting It All Together

In short, we can say that the Mark3 scheduler works as follows:

- The scheduler is run whenever a `Thread::Yield()` is called by a user, as part of blocking calls, or whenever a new thread is started
- The Mark3 scheduler is deterministic, selecting the next thread to run in fixed-time
- The scheduler only chooses the next thread to run, the context switch SWI consumes that information to get that thread running

- Where there are multiple ready threads in the highest populated priority level, a software timer is used to manage round-robin scheduling

While we've covered a lot of ground in this chapter, there's not a whole lot of code involved. However, the code that performs these operations is quite nuanced and subtle. If you're interested in seeing how this all works in practice, I suggest reading through the Mark3 source code (which is heavily annotated), and stepping through the code with a simulator/emulator.

## Chapter 8

# Porting Mark3 - An Example Using ARM Cortex-M0

This document serves as both a real-world example of how Mark3 can be ported to new architectures, and as a practical reference for using the RTOS support functionality baked in modern ARM Cortex-M series microcontrollers.

Most of this documentation here is taken directly from the source code found in the `/kernel/cpu/cm0/` ports directory, with additional annotations to explain the port in more detail. Note that a familiarity with Cortex-M series parts will go a long way to understanding the subject matter presented, especially a basic understanding of the ARM CPU registers, exception models, and OS support features (PendSV, SysTick and SVC).

Porting Mark3 to a new architecture consists of a few basic pieces; for developers familiar with the target architecture and the porting process, it's not a tremendously onerous endeavour to get Mark3 up-and-running somewhere new. For starters, all non-portable components are completely isolated in the source-tree under `/embedded/kernel/<CPU>/<VARIANT>/<TOOLCHAIN>/`, where `<CPU>` is the architecture, `<VARIANT>` is the vendor/part, and `<TOOLCHAIN>` is the compiler tool suite used to build the code.

From within the specific port folder, a developer needs only implement a few classes and headers that define the port-specific behavior of Mark3:

- [KernelSWI](#) ([kernelswi.cpp](#)/kernelswi.h) - Provides a maskable software-triggered interrupt used to perform context switching.
- [KernelTimer](#) ([kerneltimer.cpp](#)/kerneltimer.h) - Provides either a fixed-frequency or programmable-interval timer, which triggers an interrupt on expiry. This is used for implementing round-robin scheduling, thread-sleeps, and generic software timers.
- [Profiler](#) ([kprofile.cpp](#)/kprofile.h) - Contains code for runtime code-profiling. This is optional and may be stubbed out if left unimplemented (we won't cover profiling timers here).
- [ThreadPort](#) ([threadport.cpp](#)/threadport.h) - The meat-and-potatoes of the port code lives here. This class contains architecture/part-specific code used to initialize threads, implement critical-sections, perform context-switching, and start the kernel. Most of the time spent in this article focuses on the code found here.

Summarizing the above, these modules provide the following list of functionality:

- [Thread](#) stack initialization
- [Kernel](#) startup and first thread entry
- Context switch and SWI
- [Kernel](#) timers
- Critical Sections

The implementation of each of these pieces will be analyzed in detail in the sections that follow.

## 8.1 Thread Stack Initialization

Before a thread can be used, its stack must first be initialized to its default state. This default state ensures that when the thread is scheduled for the first time and its context restored, that it will cause the CPU to jump to the user's specified entry-point function.

All of the platform independent thread setup is handled by the generic kernel code. However, since every CPU architecture has its own register set, and stacks different information as part of an interrupt/exception, we have to implement this thread setup code for each platform we want the kernel to support (Combination of Architecture + Variant + Toolchain).

In the ARM Cortex-M0 architecture, the stack frame consists of the following information:

### a) Exception Stack Frame

Contains the 8 registers which the ARM Cortex-M0 CPU automatically pushes to the stack when entering an exception. The following registers are included (in stack'd order):

```
[ XPSR ] <-- Highest address in context
[ PC   ]
[ LR   ]
[ R12  ]
[ R3   ]
[ R2   ]
[ R1   ]
[ R0   ]
```

**XPSR** – This is the CPU's status register. We need to set this to 0x01000000 (the "T" bit), which indicates that the CPU is executing in "thumb" mode. Note that ARMv6m and ARMv7m processors only run thumb2 instructions, so an exception is liable to occur if this bit ever gets cleared.

**PC** – Program Counter. This should be set with the initial entry point (function pointer) for that the user wishes to start executing with this thread.

**LR** - The base link register. Normally, this register contains the return address of the calling function, which is where the CPU jumps when a function returns. However, our threads generally don't return (and if they do, they're placed into the stop state). As a result we can leave this as 0.

The other registers in the stack frame are generic working registers, and have no special meaning, with the exception that R0 will hold the user's argument value passed into the entrypoint.

### b) Complimentary CPU Register Context

```
[ R11   ]
...
[ R4    ] <-- Lowest address in context
```

These are the other general-purpose CPU registers that need to be backed up/restored on a context switch, but aren't stacked by default on a Cortex-M0 exception. If there were any additional hardware registers to back up, then we'd also have to include them in this part of the context as well.

As a result, these registers all need to be manually pushed to the stack on stack creation, and will need to be explicitly pushed and pop as part of a normal context switch.

With this default exception state in mind, the following code is used to initialize a thread's stack for a Cortex-M0.

```
void ThreadPort::InitStack(Thread *pclThread_)
{
    K_ULONG *pulStack;
    K_ULONG *pulTemp;
    K_ULONG ulAddr;
    K_USHORT i;

    // Get the entrypoint for the thread
    ulAddr = (K_ULONG)(pclThread_>m_pfEntryPoint);

    // Get the top-of-stack pointer for the thread
    pulStack = (K_ULONG*)pclThread_>m_pwStackTop;

    // Initialize the stack to all FF's to aid in stack depth checking
    pulTemp = (K_ULONG*)pclThread_>m_pwStack;
```

```

for (i = 0; i < pclThread->m_usStackSize / sizeof(K_ULONG); i++)
{
    pulTemp[i] = 0xFFFFFFFF;
}

PUSH_TO_STACK(pulStack, 0);          // Apply one word of padding

/-- Simulated Exception Stack Frame --
PUSH_TO_STACK(pulStack, 0x01000000); // XSPR - set "T" bit for thumb-mode
PUSH_TO_STACK(pulStack, ulAddr);     // PC
PUSH_TO_STACK(pulStack, 0);          // LR
PUSH_TO_STACK(pulStack, 0x12);
PUSH_TO_STACK(pulStack, 0x3);
PUSH_TO_STACK(pulStack, 0x2);
PUSH_TO_STACK(pulStack, 0x1);
PUSH_TO_STACK(pulStack, (K_ULONG)pclThread->m_pvArg); // R0 = argument

/-- Simulated Manually-Stacked Registers --
PUSH_TO_STACK(pulStack, 0x11);
PUSH_TO_STACK(pulStack, 0x10);
PUSH_TO_STACK(pulStack, 0x09);
PUSH_TO_STACK(pulStack, 0x08);
PUSH_TO_STACK(pulStack, 0x07);
PUSH_TO_STACK(pulStack, 0x06);
PUSH_TO_STACK(pulStack, 0x05);
PUSH_TO_STACK(pulStack, 0x04);
pulStack++;

pclThread->m_pwStackTop = pulStack;
}

```

## 8.2 Kernel Startup

The same general process applies to starting the kernel on an ARM Cortex-M0 as on other platforms. Here, we initialize and start the platform specific timer and software-interrupt modules, find the first thread to run, and then jump to that first thread.

Now, to perform that last step, we have two options:

1) Simulate a return from an exception manually to start the first thread, or.. 2) Use a software interrupt to trigger the first "Context Restore/Return from Interrupt"

For 1), we basically have to restore the whole stack manually, not relying on the CPU to do any of this for us. That's certainly doable, but not all Cortex parts support this (other members of the family support privileged modes, etc.). That, and the code required to do this is generally more complex due to all of the exception-state simulation. So, we will opt for the second option instead.

To implement a software to start our first thread, we will use the SVC instruction to generate an exception. From that exception, we can then restore the context from our first thread, set the CPU up to use the right "process" stack, and return-from-exception back to our first thread. We'll explore the code for that later.

But, before we can call the SVC exception, we're going to do a couple of things.

First, we're going to reset the default MSP stack pointer to its original top-of-stack value. The rationale here is that we no longer care about the data on the MSP stack, since calling the SVC instruction triggers a chain of events from which we never return. The MSP is also used by all exception-handling, so regaining a few words of stack here can be useful. We'll also enable all maskable exceptions at this point, since this code results in the kernel being started with the CPU executing the RTOS threads, at which point a user would expect interrupts to be enabled.

Note, the default stack pointer location is stored at address 0x00000000 on all ARM Cortex M0 parts. That explains the code below.

```

void ThreadPort_StartFirstThread( void )
{
    asm(
        " ldr r1, [r0] \n" // Reset the MSP to the default base address
        " msr msp, r1 \n"
        " cpsie i \n"      // Enable interrupts
        " svc 0 \n"        // Jump to SVC Call
    );
}

```

## 8.3 First Thread Entry

This handler has the job of taking the first thread object's stack, and restoring the default state data in a way that ensures that the thread starts executing when returning from the call.

We also keep in mind that there's an 8-byte offset from the beginning of the thread object to the location of the thread stack pointer. This offset is a result of the thread object inheriting from the linked-list node class, which has 8-bytes of data. This is stored first in the object, before the first element of the class, which is the "stack top" pointer.

The following assembly code shows how the SVC call is implemented in Mark3 for the purpose of starting the first thread.

```
get_thread_stack:
    ; Get the stack pointer for the current thread
    ldr r0, g_pstCurrent
    ldr r1, [r0]
    add r1, #8
    ldr r2, [r1]          ; r2 contains the current stack-top

load_manually_placed_context_r11_r8:
    ; Handle the bottom 32-bytes of the stack frame
    ; Start with r11-r8, because only r0-r7 can be used
    ; with ldmia on CM0.
    add r2, #16
    ldmia r2!, {r4-r7}
    mov r11, r7
    mov r10, r6
    mov r9, r5
    mov r8, r4

set_psp:
    ; Since r2 is coincidentally back to where the stack pointer should be,
    ; Set the program stack pointer such that returning from the exception handler
    msr psp, r2

load_manually_placed_context_r7_r4:
    ; Get back to the bottom of the manually stacked registers and pop.
    sub r2, #32
    ldmia r2!, {r4-r7} ; Register r4-r11 are restored.

set_thread_and_privilege_modes:
    ; Also modify the control register to force use of thread mode as well
    ; For CM3 forward-compatibility, also set user mode.
    mrs r0, control
    mov r1, #0x03
    orr r0, r1
    control, r0

set_lr:
    ; Set up the link register such that on return, the code operates in thread mode using the PSP
    ; To do this, we or 0x0D to the value stored in the lr by the exception hardware EXC_RETURN.
    ; Alternately, we could just force lr to be 0xFFFFFFF0 (we know that's what we want from the hardware,
    ; anyway)
    mov r0, #0x0D
    mov r1, lr
    orr r0, r1

exit_exception:
    ; Return from the exception handler. The CPU will automatically unstack R0-R3, R12, PC, LR, and xPSR
    ; for us. If all goes well, our thread will start execution at the entrypoint, with the us-specified
    ; argument.
    bx r0
```

## 8.4 Context Switching

On ARM Cortex parts, there's dedicated hardware that's used primarily to support RTOS (or RTOS-like) functionality. This functionality includes the SysTick timer, and the PendSV Exception. SysTick is used for a tick-based kernel timer, while the PendSV exception is used for performing context switches. In reality, it's a "special SVC" call that's designed to be lower-overhead, in that it isn't mux'd with a bunch of other system or application functionality.

So how do we go about actually implementing a context switch here? There are a lot of different parts involved, but it essentially comes down to 3 steps:

- 1) Saving the context. [Thread](#)'s top-of-stack value is stored, all registers are stacked. We're good to go!
- 2) Swap threads. We swap the [Scheduler](#)'s "next" thread with the "current" thread.

3) Restore Context. This is more or less identical to what we did when restoring the first context. Some operations may be optimized for data already stored in registers.

The code used to implement these steps on Cortex-M0 is presented below:

```
void PendSV_Handler(void)
{
    ASM(
        // Thread_SaveContext()
        " ldr r1, CURR_ \n"
        " ldr r1, [r1] \n "
        " mov r3, r1 \n "
        " add r3, #8 \n "

        // Grab the psp and adjust it by 32 based on the extra registers we're going
        // to be manually stacking.
        " mrs r2, psp \n "
        " sub r2, #32 \n "

        // While we're here, store the new top-of-stack value
        " str r2, [r3] \n "

        // And, while r2 is at the bottom of the stack frame, stack r7-r4
        " stmia r2!, {r4-r7} \n "

        // Stack r11-r8
        " mov r7, r11 \n "
        " mov r6, r10 \n "
        " mov r5, r9 \n "
        " mov r4, r8 \n "
        " stmia r2!, {r4-r7} \n "

        // Equivalent of Thread_Swap() - performs g_pstCurrent = g_pstNext
        " ldr r1, CURR_ \n"
        " ldr r0, NEXT_ \n"
        " ldr r0, [r0] \n"
        " str r0, [r1] \n"

        // Thread_RestoreContext()
        // Get the pointer to the next thread's stack
        " add r0, #8 \n "
        " ldr r2, [r0] \n "

        // Stack pointer is in r2, start loading registers from the "manually-stacked" set
        // Start with r11-r8, since these can't be accessed directly.
        " add r2, #16 \n "
        " ldmbia r2!, {r4-r7} \n "
        " mov r11, r7 \n "
        " mov r10, r6 \n "
        " mov r9, r5 \n "
        " mov r8, r4 \n "

        // After subbing R2 #16 manually, and #16 through ldmbia, our PSP is where it
        // needs to be when we return from the exception handler
        " msr psp, r2 \n "

        // Pop manually-stacked R4-R7
        " sub r2, #32 \n "
        " ldmbia r2!, {r4-r7} \n "

        // lr contains the proper EXC_RETURN value
        // we're done with the exception, so return back to the newly-chosen thread
        " bx lr \n "
        " nop \n "

        // Must be 4-byte aligned. Also - GNU assembler, I hate you for making me resort to this.
        " NEXT_: .word g_pstNext \n"
        " CURR_: .word g_pstCurrent \n"
    );
}
```

## 8.5 Kernel Timers

ARM Cortex-M series microcontrollers each contain a SysTick timer, which was designed to facilitate a fixed-interval RTOS timer-tick. This timer is a precise 24-bit down-count timer, run at the main CPU clock frequency, that can be programmed to trigger an exception when the timer expires. The handler for this exception can thus be used to drive software timers throughout the system on a fixed interval.

Unfortunately, this hardware is extremely simple, and does not offer the flexibility of other timer hardware commonly

implemented by MCU vendors - specifically a suitable timer prescaler that can be used to generate efficient, long-counting intervals. As a result, while the "generic" port of Mark3 for Cortex-M0 leverages the common SysTick timer interface, it only supports the tick-based version of the kernel's timer (note that specific Cortex-M0 ports such as the Atmel SAMD20 do have tickless timers).

Setting up a tick-based [KernelTimer](#) class to use the SysTick timer is, however, extremely easy, as is illustrated below:

```
void KernelTimer::Start(void)
{
    SysTick_Config(SYSTEM_FREQ / 1000); // 1KHz fixed clock...
    NVIC_EnableIRQ(SysTick_IRQn);
}
```

In this instance, the call to `SysTick_Config()` generates a 1kHz system-tick signal, and the `NVIC_EnableIRQ()` call ensures that a SysTick exception is generated for each tick. All other functions in the Cortex version of the [KernelTimer](#) class are essentially stubbed out (see the source for more details).

Note that the functions used in this call are part of the ARM Cortex Microcontroller Software Interface Standard (CMSIS), and are supplied by all parts vendors selling Cortex hardware. This greatly simplifies the design of our port-code, since we can be reasonably assured that these APIs will work the same on all devices.

The handler code called when a SysTick exception occurs is basically the same as on other platforms (such as AVR), except that we explicitly clear the "exception pending" bit before returning. This is implemented in the following code:

```
void SysTick_Handler(void)
{
    #if KERNEL_USE_TIMERS
        TimerScheduler::Process();
    #endif
    #if KERNEL_USE_QUANTUM
        Quantum::UpdateTimer();
    #endif

    // Clear the systick interrupt pending bit.
    SCB->ICSR |= SCB_ICSR_PENDSTCLR_Msk;
}
```

## 8.6 Critical Sections

A "critical section" is a block of code whose execution cannot be interrupted by means of context switches or an interrupt. In a traditional single-core operating system, it is typically implemented as a block of code where the interrupts are disabled - this is also the approach taken by Mark3. Given that every CPU has its own means of disabling/enabling interrupts, the implementation of the critical section APIs is also non-portable.

In the Cortex-M0 port, we implement the two critical section APIs ([CS\\_ENTER\(\)](#) and [CS\\_EXIT\(\)](#)) as function-like macros containing inline assembly. All uses of these calls are called in pairs within a function and must take place at the same level-of-scope. Also, as nesting may occur (critical section within a critical section), this must be taken into account in the code.

In general, [CS\\_ENTER\(\)](#) performs the following tasks:

- Cache the current interrupt-enabled state within a local variable in the thread's state
- Disable interrupts

Conversely, [CS\\_EXIT\(\)](#) performs the following tasks:

- Read the original interrupt-enabled state from the cached value
- Restore interrupts to the original value

On Cortex-M series microcontrollers, the PRIMASK special register contains a single status bit which can be used to enable/disable all maskable interrupts at once. This register can be read directly to examine or modify its state. For

convenience, ARMv6m provides two instructions to enable/disable interrupts - cpsid (disable interrupts) and cpsie (enable interrupts). Mark3 implements these steps according to the following code:

```
//-----
#define CS_ENTER() \
{ \
    K_ULONG __ulRegState; \
    asm ( \
        " mrs r0, PRIMASK \n" \
        " mov %[STATUS], r0 \n" \
        " cpsid i \n " \
        : [STATUS] "=r" (__ulRegState) \
        ); \
}

//-----
#define CS_EXIT() \
    asm ( \
        " mov r0, %[STATUS] \n" \
        " msr primask, r0 \n" \
        : \
        : [STATUS] "r" (__ulRegState) \
        ); \
}
```

## 8.7 Conclusion

In this chapter we have investigated how the main non-portable areas of the Mark3 RTOS are implemented on a Cortex-M0 microcontroller. Mark3 leverages all of the hardware blocks designed to enable RTOS functionality on ARM Cortex-M series microcontrollers: the SVC call provides the mechanism by which we start the kernel, the PendSV exception provides the necessary software interrupt, and the SysTick timer provides an RTOS tick. As a result, Mark3 is a perfect fit for these devices - and as a result of this approach, the same RTOS port code should work with little to no modification on all ARM Cortex-M parts.

We have discussed what functionality in the RTOS is not portable, and what interfaces must be implemented in order to complete a fully-functional port. The five specific areas which are non-portable (stack initialization, kernel startup/entry, kernel timers, context switching, and critical sections) have been discussed in detail, with the platform-specific source provided as a practical reference to ARM-specific OS features, as well as Mark3's porting infrastructure. From this example (and the accompanying source), it should be possible for an experienced developers to create a port Mark3 to other microcontroller targets.

## Chapter 9

# Build System

Mark3 is distributed with a recursive makefile build system, allowing the entire source tree to be built into a series of libraries with simple make commands.

The way the scripts work, every directory with a valid makefile is scanned, as well as all of its subdirectories. The build then generates binary components for all of the components it finds -libraries and executables. All libraries that are generated can then be imported into an application using the linker without having to copy-and-paste files on a module-by-module basis. Applications built during this process can then be loaded onto a device directly, without requiring a GUI-based IDE. As a result, Mark3 integrates well with 3rd party tools for continuous-integration and automated testing.

This modular framework allows for large volumes of libraries and binaries to be built at once - the default build script leverages this to build all of the examples and unit tests at once, linking against the pre-built kernel, services, and drivers. Whatever can be built as a library is built as a library, promoting reuse throughout the platform, and enabling Mark3 to be used as a platform, with an ecosystem of libraries, services, drivers and applications.

### 9.1 Source Layout

One key aspect of Mark3 is that system features are organized into their own separate modules. These modules are further grouped together into folders based on the type of features represented:

Root	Base folder, contains recursive makefiles for build system
bootloader	Mark3 Bootloader code for AVR
build	Makefile support for various platforms
doc	Documentation (including this)
drivers	Device driver code
example	Example applications
kernel	Basic Mark3 Components (the focus of this manual)
cpu	CPU-specific porting code
services	Utility code and services, extended system features
stage	Staging directory, where the build system places artifacts
tests	Unit tests, written as C/C++ applications

### 9.2 Building the kernel

The base.mak file determines how the kernel, drivers, and libraries are built, for what targets, and with what options. Most of these options can be copied directly from the options found in your IDE managed projects. Below is an overview of the main variables used to configure the build.

STAGE	- Location in the filesystem where the build output is stored
ROOT_DIR	- The location of the root source tree
ARCH	- The CPU architecture to build against
VARIANT	- The variant of the above CPU to target
TOOLCHAIN	- Which toolchain to build with (dependent on ARCH and VARIANT)

Build.mak contains the logic which is used to perform the recursive make in all directories. Unless you really know what you're doing, it's best to leave this as-is.

You must make sure that all required paths are set in your system environment variables so that they are accessible through from the command-line.

Once configured, you can build the source tree using the various make targets:

- make headers
  - copy all headers in each module's /public subdirectory to the location specified by STAGE environment variable's ./inc subdirectory.
- make library
  - regenerate all objects copy marked as libraries (i.e. the kernel + drivers). Resulting binaries are copied into STAGE's ./lib subdirectory.
- make binary
  - build all executable projects in the root directory structure. In the default distribution, this includes the basic set of demos.

To add new components to the recursive build system, simply add your code into a new folder beneath the root install location.

Source files, the module makefile and private header files go directly in the new folder, while public headers are placed in a ./public subdirectory. Create a ./obj directory to hold the output from the builds.

The contents of the module makefile looks something like this:

```
# Include common prelude make file
include $(ROOT_DIR)base.mak

# If we're building a library, set IS_LIB and LIBNAME
# If we're building an app, set IS_APP and APPNAME
IS_LIB=1
LIBNAME=mylib

#this is the list of the source modules required to build the kernel
CPP_SOURCE = mylib.cpp \
             someotherfile.cpp

# Similarly, C-language source would be under the C_SOURCE variable.

# Include the rest of the script that is actually used for building the
# outputs
include $(ROOT_DIR)build.mak
```

Once you've placed your code files in the right place, and configured the makefile appropriately, a fresh call to make headers, make library, then make binary will guarantee that your code is built.

Now, you can still copy-and-paste the required kernel, port, and drivers, directly into your application avoiding the whole process of using make from the command line. To do this, run "make source" from the root directory in svn, and copy the contents of /stage/src into your project. This should contain the source to the kernel, all drivers, and all services that are in the tree - along with the necessary header files.

## 9.3 Building on Windows

Building Mark3 on Windows is the same as on Linux, but there are a few prerequisites that need to be taken into consideration before the build scripts and makefiles will work as expected.

### Step 1 - Install Latest Atmel Studio IDE

Atmel Studio contains the AVR8 GCC toolchain, which contains the necessary compilers, assemblers, and platform support required to turn the source modules into libraries and executables.

To get Atmel Studio, go to the Atmel website (<http://www.atmel.com>) and register to download the latest version. This is a free download (and rather large). The included IDE (if you choose to use it) is very slick, as it's based on Visual Studio, and contains a wonderful cycle-accurate simulator for AVR devices. In fact, the simulator is so good that most of the kernel and its drivers were developed using this tool.

Once you have downloaded and installed Atmel Studio, you will need to add the location of the AVR toolchain to the PATH environment variable.

To do this, go to Control Panel -> System and Security -> System -> Advanced System Settings, and edit the PATH variable. Append the location of the toolchain bin folder to the end of the variable.

On Windows 7 x64, it should look something like this:

C: Files (x86) Toolchain GCC\Native\3.4.2.1002-gnu-toolchain

#### Step 2 - Install MinGW and MinSys

MinGW (and MinSys in particular) provide a unix-like environment that runs under windows. Some of the utilities provided include a version of the bash shell, and GNU standard make - both which are required by the Mark3 recursive build system.

The MinGW installer can be downloaded from its project page on SourceForge. When installing, be sure to select the "MinSys" component.

Once installed, add the MinSys binary path to the PATH environment variable, in a similar fashion as with Atmel Studio in Step 1.

#### Step 3 - Setup Include Paths in Platform Makefile

The AVR header file path must be added to the "platform.mak" makefile for each AVR Target you are attempting to build for. These files can be located under /embedded/build/avr/atmegaXXX/. The path to the includes directory should be added to the end of the CFLAGS and CPPFLAGS variables, as shown in the following:

```
TEST_INC="/c/Program Files (x86)/Atmel/Atmel Toolchain/AVR8
GCC/Native/3.4.2.1002/avr8-gnu-toolchain/include"
CFLAGS += -I$(TEST_INC)
CPPFLAGS += -I$(TEST_INC)
```

#### Step 4 - Build Mark3 using Bash

Launch a terminal to your Mark3 base directory, and cd into the "embedded" folder. You should now be able to build Mark3 by running "bash ./build.sh" from the command-line.

Alternately, you can run bash itself, building Mark3 by running ./build.sh or the various make targets using the same syntax as documented previously.

Note - building on Windows is *slow*. This has a lot to do with how "make" performs under windows. There are faster substitutes for make (such as cs-make) that are exponentially quicker, and approach the performance of make on Linux. Other mechanisms, such as running make with multiple concurrent jobs (i.e. "make -j4") also helps significantly, especially on systems with multicore CPUs.

## 9.4 Exporting the Source

In addition to providing a full recursive-make based build system, the kernel source for a given target can be exported directly to a .zip file for convenience. Run export.sh for any supported target (the full list of targets is listed below) to create a .zip archive of the kernel source and port code. If doxygen and pdflatex are available from your OS, documentation will also be generated (HTML and PDF) on the fly and included in the archive.

### 9.4.1 Supported targets

Currently, Mark3 supports the following AVR parts:

- atmega328p

- arduino
- atmega644
- atmega1284p
- atxmega256a3 (\*experimental)

The following Cortex M0 parts are supported as well:

- Atmel samd20
- ST Micro stm32f0

# Chapter 11

## Profiling Results

The following profiling results were obtained using an ATmega328p @ 16MHz.

The test cases are designed to make use of the kernel profiler, which accurately measures the performance of the fundamental system APIs, in order to provide information for user comparison, as well as to ensure that regressions are not being introduced into the system.

### 11.1 Date Performed

Fri Oct 17 21:37:19 EDT 2014

### 11.2 Compiler Information

The kernel and test code used in these results were built using the following compiler: `./scripts/profile_sim.sh: 50: ./scripts/profile_sim.sh: /home/moslevin/atmel/bin/avr-gcc: not found`

### 11.3 Profiling Results

- Semaphore Initialization: 17 cycles (averaged over 84 iterations)
- Semaphore Post (uncontested): 983 cycles (averaged over 84 iterations)
- Semaphore Pend (uncontested): 849 cycles (averaged over 83 iterations)
- Semaphore Flyback Time (Contested Pend): 3337 cycles (averaged over 83 iterations)
- Mutex Init: 393 cycles (averaged over 84 iterations)
- Mutex Claim: 108 cycles (averaged over 84 iterations)
- Mutex Release: 873 cycles (averaged over 84 iterations)
- Thread Initialize: 8217 cycles (averaged over 83 iterations)
- Thread Start: 761 cycles (averaged over 83 iterations)
- Context Switch: 161 cycles (averaged over 83 iterations)
- Thread Schedule: 73 cycles (averaged over 83 iterations)

## Chapter 12

# Code Size Profiling

The following report details the size of each module compiled into the kernel.

The size of each component is dependent on the flags specified in [mark3cfg.h](#) at compile time. Note that these sizes represent the maximum size of each module before dead code elimination and any additional link-time optimization, and represent the maximum possible size that any module can take.

The results below are for profiling on Atmel AVR atmega328p-based targets using gcc. Results are not necessarily indicative of relative or absolute performance on other platforms or toolchains.

## Chapter 14

# Class Index

### 14.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

<a href="#">Atomic</a>	
The <a href="#">Atomic</a> class	65
<a href="#">BitStreamer</a>	67
<a href="#">BlockHeap</a>	
Single-block-size heap	68
<a href="#">BlockingObject</a>	
Class implementing thread-blocking primitives	70
<a href="#">ButtonControl</a>	72
<a href="#">CheckBoxControl</a>	74
<a href="#">CircularLinkedList</a>	
Circular-linked-list data type, inherited from the base <a href="#">LinkedList</a> type	76
<a href="#">CommandLine_t</a>	
Structure containing multiple representations for command-line data	77
<a href="#">DCPU</a>	
<a href="#">DCPU</a> emulator, used for running code out of EEPROM, RAM, or other memory interfaces than FLASH	78
<a href="#">DCPU_Registers</a>	
Structure defining the <a href="#">DCPU</a> hardware registers	82
<a href="#">DCPUPlugin</a>	
Class used to provide the hardware device abstraction between the <a href="#">DCPU-16</a> emulator/VM and the host system	83
<a href="#">DevNull</a>	
This class implements the "default" driver (/dev/null)	85
<a href="#">DoubleLinkedList</a>	
Doubly-linked-list data type, inherited from the base <a href="#">LinkedList</a> type	88
<a href="#">DrawBitmap_t</a>	
Defines a bitmap	89
<a href="#">DrawCircle_t</a>	
Defines a circle	90
<a href="#">DrawEllipse_t</a>	
Defines a ellipse	90
<a href="#">DrawLine_t</a>	
Defines a simple line	91
<a href="#">DrawMove_t</a>	
Simple 2D copy/paste	91
<a href="#">DrawPoint_t</a>	
Defines a pixel	92

<a href="#">DrawPoly_t</a>	Defines the structure of an arbitrary polygon . . . . .	92
<a href="#">DrawRectangle_t</a>	Defines a rectangle . . . . .	93
<a href="#">DrawStamp_t</a>	Defines a 1-bit 2D bitmap of arbitrary resolution . . . . .	94
<a href="#">DrawText_t</a>	Defines a bitmap-rendered string . . . . .	94
<a href="#">DrawVector_t</a>	Specifies a single 2D point . . . . .	95
<a href="#">DrawWindow_t</a>	Defines the active window - establishes boundaries for drawing on the current display . . . . .	95
<a href="#">Driver</a>	Base device-driver class used in hardware abstraction . . . . .	96
<a href="#">DriverList</a>	List of <a href="#">Driver</a> objects used to keep track of all device drivers in the system . . . . .	99
<a href="#">EventFlag</a>	Blocking object, similar to a semaphore or mutex, commonly used for synchronizing thread execution based on events occurring within the system . . . . .	100
<a href="#">FixedHeap</a>	Fixed-size-block heap allocator with multiple block sizes . . . . .	103
<a href="#">Font_t</a>	. . . . .	105
<a href="#">GamePanelControl</a>	. . . . .	105
<a href="#">GlobalMessagePool</a>	Implements a list of message objects shared between all threads . . . . .	107
<a href="#">Glyph_t</a>	. . . . .	108
<a href="#">GraphicsDriver</a>	Defines the base graphics driver class, which is inherited by all other graphics drivers . . . . .	108
<a href="#">GroupBoxControl</a>	. . . . .	113
<a href="#">GuiControl</a>	GUI Control Base Class . . . . .	114
<a href="#">GuiEvent_t</a>	Composite UI event structure . . . . .	122
<a href="#">GuiEventSurface</a>	GUI Event Surface Object . . . . .	122
<a href="#">GuiWindow</a>	Basic Window Class . . . . .	125
<a href="#">HeapConfig</a>	Heap configuration object . . . . .	131
<a href="#">JoystickEvent_t</a>	Joystick UI event structure . . . . .	132
<a href="#">Kernel</a>	Class that encapsulates all of the kernel startup functions . . . . .	132
<a href="#">KernelSWI</a>	Class providing the software-interrupt required for context-switching in the kernel . . . . .	134
<a href="#">KernelTimer</a>	Hardware timer interface, used by all scheduling/timer subsystems . . . . .	135
<a href="#">KeyEvent_t</a>	Keyboard UI event structure definition . . . . .	137
<a href="#">LabelControl</a>	. . . . .	138
<a href="#">LinkedList</a>	Abstract-data-type from which all other linked-lists are derived . . . . .	140
<a href="#">LinkedListNode</a>	Basic linked-list node data structure . . . . .	141
<a href="#">MemUtil</a>	String and Memory manipulation class . . . . .	143
<a href="#">Message</a>	Class to provide message-based IPC services in the kernel . . . . .	147

<a href="#">MessageQueue</a>	
List of messages, used as the channel for sending and receiving messages between threads	149
<a href="#">MouseEvent_t</a>	
Mouse UI event structure	150
<a href="#">Mutex</a>	
Mutual-exclusion locks, based on <a href="#">BlockingObject</a>	151
<a href="#">NLFS</a>	
Nice Little File System class	153
<a href="#">NLFS_Block_t</a>	
Block data structure	165
<a href="#">NLFS_File</a>	
The <a href="#">NLFS_File</a> class	165
<a href="#">NLFS_File_Node_t</a>	
Data structure for the "file" FS-node type	167
<a href="#">NLFS_File_Stat_t</a>	
Structure used to report the status of a given file	168
<a href="#">NLFS_Host_t</a>	
Union used for managing host-specific pointers/data-types	169
<a href="#">NLFS_Node_t</a>	
Filesystem node data structure	169
<a href="#">NLFS_RAM</a>	
The <a href="#">NLFS_RAM</a> class	170
<a href="#">NLFS_Root_Node_t</a>	
Data structure for the Root-configuration FS-node type	174
<a href="#">NotificationControl</a>	175
<a href="#">Option_t</a>	
Structure used to represent a command-line option with its arguments	177
<a href="#">PanelControl</a>	178
<a href="#">Profiler</a>	
System profiling timer interface	180
<a href="#">ProfileTimer</a>	
Profiling timer	181
<a href="#">ProgressControl</a>	183
<a href="#">PseudoRandom</a>	
The <a href="#">PseudoRandom</a> class	185
<a href="#">Quantum</a>	
Static-class used to implement <a href="#">Thread</a> quantum functionality, which is a key part of round-robin scheduling	187
<a href="#">Scheduler</a>	
Priority-based round-robin <a href="#">Thread</a> scheduling, using ThreadLists for housekeeping	189
<a href="#">Screen</a>	193
<a href="#">ScreenList</a>	194
<a href="#">ScreenManager</a>	195
<a href="#">Semaphore</a>	
Counting semaphore, based on <a href="#">BlockingObject</a> base class	196
<a href="#">ShellCommand_t</a>	
Data structure defining a lookup table correlating a command name to its handler function	200
<a href="#">ShellSupport</a>	
Features utility functions which handle token processing, option/parameter lookup, and functions making it generally trivial to implement a lightweight custom shell	200
<a href="#">SlickButtonControl</a>	202
<a href="#">SlickGroupBoxControl</a>	204
<a href="#">SlickProgressControl</a>	206
<a href="#">Slip</a>	
Object used to frame communications over an abstract device using the serial-line internet protocol (SLIP)	208
<a href="#">SlipDataVector</a>	
Data structure used for vector-based SLIP data transmission	210

<a href="#">SlipMux</a>	Static-class which implements a multiplexed stream of SLIP data over a single interface . . . .	211
<a href="#">SlipTerm</a>	Class implementing a simple debug terminal interface . . . . .	213
<a href="#">StubControl</a>	Stub control class, used for testing out the GUI framework where certain controls have not yet been implemented . . . . .	215
<a href="#">SystemHeap</a>	Implements a heap which is accessible from all components in the system . . . . .	216
<a href="#">TextFX_t</a>	. . . . .	218
<a href="#">Thread</a>	Object providing fundamental multitasking support in the kernel . . . . .	218
<a href="#">ThreadList</a>	This class is used for building thread-management facilities, such as schedulers, and blocking objects . . . . .	227
<a href="#">ThreadPort</a>	Class defining the architecture specific functions required by the kernel . . . . .	229
<a href="#">Tile_8x8</a>	. . . . .	230
<a href="#">TileDef_t</a>	<a href="#">TileDef_t</a> Structure defining parameters for a color-indexed tile . . . . .	231
<a href="#">Timer</a>	<a href="#">Timer</a> - an event-driven execution context based on a specified time interval . . . . .	231
<a href="#">TimerEvent_t</a>	<a href="#">Timer</a> UI event structure . . . . .	235
<a href="#">TimerList</a>	<a href="#">TimerList</a> class - a doubly-linked-list of timer objects . . . . .	235
<a href="#">TimerScheduler</a>	"Static" Class used to interface a global <a href="#">TimerList</a> with the rest of the kernel . . . . .	237
<a href="#">Token_t</a>	Token descriptor struct format . . . . .	238
<a href="#">TouchEvent_t</a>	Touch UI event structure . . . . .	239
<a href="#">Transaction</a>	The <a href="#">Transaction</a> class . . . . .	239
<a href="#">TransactionQueue</a>	The <a href="#">TransactionQueue</a> class . . . . .	242
<a href="#">UnitTest</a>	Class used to implement a simple unit-testing framework . . . . .	244
<a href="#">WriteBuffer16</a>	This class is used to provide a general-purpose, fully thread-safe circular buffer implementation which can be used for creating tracebuffers, data logging queues, transaction queues, etc . . .	247

## Chapter 15

# File Index

### 15.1 File List

Here is a list of all documented files with brief descriptions:

/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">atomic.cpp</a>	
Basic <a href="#">Atomic</a> Operations . . . . .	251
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">atomic.h</a>	
Basic <a href="#">Atomic</a> Operations . . . . .	253
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">bitstream.cpp</a>	??
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">bitstream.h</a>	??
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">blocking.cpp</a>	
Implementation of base class for blocking objects . . . . .	254
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">blocking.h</a>	
Blocking object base class declarations . . . . .	256
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">colordepth.h</a>	??
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">colorspace.h</a>	??
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">control_button.cpp</a>	
GUI Button Control Implementation . . . . .	257
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">control_button.h</a>	
GUI Button Control . . . . .	260
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">control_checkbox.cpp</a>	
Checkbox Control . . . . .	262
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">control_checkbox.h</a>	
Checkbox Control . . . . .	265
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">control_gamepanel.cpp</a>	
GUI Panel Control Implementation with joystick control and tick-based state machine updates . . . . .	266
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">control_gamepanel.h</a>	
GUI Game Panel Control . . . . .	267
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">control_groupbox.cpp</a>	
GUI GroupBox Control Implementation . . . . .	268
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">control_groupbox.h</a>	
GUI Group Box Control . . . . .	270
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">control_label.cpp</a>	??
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">control_label.h</a>	
GUI Label Control . . . . .	271
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">control_notification.cpp</a>	
Notification pop-up control . . . . .	271
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">control_notification.h</a>	
Notification pop-up control . . . . .	273
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">control_panel.cpp</a>	
GUI Panel Control Implementation . . . . .	274

/home/moslevin/mark3-source/embedded/stage/src/control_panel.h	
GUI Panel Control	275
/home/moslevin/mark3-source/embedded/stage/src/control_progress.cpp	
GUI Progress Bar Control	276
/home/moslevin/mark3-source/embedded/stage/src/control_progress.h	
GUI Progress Bar Control	278
/home/moslevin/mark3-source/embedded/stage/src/control_slickbutton.cpp	??
/home/moslevin/mark3-source/embedded/stage/src/control_slickbutton.h	
GUI Button Control, with a flare	279
/home/moslevin/mark3-source/embedded/stage/src/control_slickgroupbox.cpp	??
/home/moslevin/mark3-source/embedded/stage/src/control_slickgroupbox.h	??
/home/moslevin/mark3-source/embedded/stage/src/control_slickprogress.cpp	
GUI Progress Bar Control, with flare	280
/home/moslevin/mark3-source/embedded/stage/src/control_slickprogress.h	
GUI Progress Bar Control, with flare	282
/home/moslevin/mark3-source/embedded/stage/src/dcpu.cpp	
Portable DCPU-16 CPU emulator	284
/home/moslevin/mark3-source/embedded/stage/src/dcpu.h	
DCPU-16 emulator	297
/home/moslevin/mark3-source/embedded/stage/src/debug_tokens.h	
Hex codes/translation tables used for efficient string tokenization	303
/home/moslevin/mark3-source/embedded/stage/src/draw.h	
Raster graphics APIs Description: Implements basic drawing functionality	305
/home/moslevin/mark3-source/embedded/stage/src/driver.cpp	
Device driver/hardware abstraction layer	308
/home/moslevin/mark3-source/embedded/stage/src/driver.h	
Driver abstraction framework	311
/home/moslevin/mark3-source/embedded/stage/src/eventflag.cpp	
Event Flag Blocking Object/IPC-Object implementation	312
/home/moslevin/mark3-source/embedded/stage/src/eventflag.h	
Event Flag Blocking Object/IPC-Object definition	317
/home/moslevin/mark3-source/embedded/stage/src/fixed_heap.cpp	
Fixed-block-size memory management	319
/home/moslevin/mark3-source/embedded/stage/src/fixed_heap.h	
Fixed-block-size heaps	321
/home/moslevin/mark3-source/embedded/stage/src/font.h	
Font structure definitions	322
/home/moslevin/mark3-source/embedded/stage/src/fontport.h	??
/home/moslevin/mark3-source/embedded/stage/src/graphics.cpp	
Generic graphics driver implementation	323
/home/moslevin/mark3-source/embedded/stage/src/graphics.h	
Graphics driver class declaration	336
/home/moslevin/mark3-source/embedded/stage/src/gui.cpp	
Graphical User Interface classes and data structure definitions	338
/home/moslevin/mark3-source/embedded/stage/src/gui.h	
Graphical User Interface classes and data structure declarations	348
/home/moslevin/mark3-source/embedded/stage/src/kernel.cpp	
Kernel initialization and startup code	353
/home/moslevin/mark3-source/embedded/stage/src/kernel.h	
Kernel initialization and startup class	354
/home/moslevin/mark3-source/embedded/stage/src/kernel_debug.h	
Macros and functions used for assertions, kernel traces, etc	355
/home/moslevin/mark3-source/embedded/stage/src/kernelswi.cpp	
Kernel Software interrupt implementation for ATMega328p	357
/home/moslevin/mark3-source/embedded/stage/src/kernelswi.h	
Kernel Software interrupt declarations	358
/home/moslevin/mark3-source/embedded/stage/src/kerneltimer.cpp	
Kernel Timer Implementation for ATMega328p	359

/home/moslevin/mark3-source/embedded/stage/src/kerneltimer.h	
Kernel Timer Class declaration	362
/home/moslevin/mark3-source/embedded/stage/src/kerneltypes.h	
Basic data type primitives used throughout the OS	363
/home/moslevin/mark3-source/embedded/stage/src/keycodes.h	
Standard ASCII keyboard codes	365
/home/moslevin/mark3-source/embedded/stage/src/kprofile.cpp	
ATMega328p Profiling timer implementation	367
/home/moslevin/mark3-source/embedded/stage/src/kprofile.h	
Profiling timer hardware interface	368
/home/moslevin/mark3-source/embedded/stage/src/ksemaphore.cpp	
Semaphore Blocking-Object Implementation	369
/home/moslevin/mark3-source/embedded/stage/src/ksemaphore.h	
Semaphore Blocking Object class declarations	373
/home/moslevin/mark3-source/embedded/stage/src/ll.cpp	
Core Linked-List implementation, from which all kernel objects are derived	375
/home/moslevin/mark3-source/embedded/stage/src/ll.h	
Core linked-list declarations, used by all kernel list types	377
/home/moslevin/mark3-source/embedded/stage/src/manual.h	
Ascii-format documentation, used by doxygen to create various printable and viewable forms	379
/home/moslevin/mark3-source/embedded/stage/src/mark3cfg.h	
Mark3 Kernel Configuration	382
/home/moslevin/mark3-source/embedded/stage/src/memutil.cpp	
Implementation of memory, string, and conversion routines	384
/home/moslevin/mark3-source/embedded/stage/src/memutil.h	
Utility class containing memory, string, and conversion routines	389
/home/moslevin/mark3-source/embedded/stage/src/message.cpp	
Inter-thread communications via message passing	391
/home/moslevin/mark3-source/embedded/stage/src/message.h	
Inter-thread communication via message-passing	394
/home/moslevin/mark3-source/embedded/stage/src/mutex.cpp	
Mutual-exclusion object	395
/home/moslevin/mark3-source/embedded/stage/src/mutex.h	
Mutual exclusion class declaration	400
/home/moslevin/mark3-source/embedded/stage/src/nlfs.cpp	
Nice Little Filesystem (NLFS) implementation for Mark3	401
/home/moslevin/mark3-source/embedded/stage/src/nlfs.h	
Nice Little Filesystem (NLFS) - a simple, embeddable filesystem	415
/home/moslevin/mark3-source/embedded/stage/src/nlfs_config.h	
NLFS configuration parameters	418
/home/moslevin/mark3-source/embedded/stage/src/nlfs_file.cpp	
Nice Little Filesystem - File Access Class	419
/home/moslevin/mark3-source/embedded/stage/src/nlfs_file.h	
NLFS file access class	424
/home/moslevin/mark3-source/embedded/stage/src/nlfs_ram.cpp	
RAM-based Nice Little Filesystem (NLFS) driver	425
/home/moslevin/mark3-source/embedded/stage/src/nlfs_ram.h	
RAM-based Nice Little Filesystem (NLFS) driver	426
/home/moslevin/mark3-source/embedded/stage/src/panic_codes.h	
Define and enumerate the possible causes of a kernel panic	427
/home/moslevin/mark3-source/embedded/stage/src/profile.cpp	
Code profiling utilities	428
/home/moslevin/mark3-source/embedded/stage/src/profile.h	
High-precision profiling timers	430
/home/moslevin/mark3-source/embedded/stage/src/profiling_results.h	??
/home/moslevin/mark3-source/embedded/stage/src/quantum.cpp	
Thread Quantum Implementation for Round-Robin Scheduling	431

/home/moslevin/mark3-source/embedded/stage/src/quantum.h	
Thread Quantum declarations for Round-Robin Scheduling	433
/home/moslevin/mark3-source/embedded/stage/src/rand_lfsr.cpp	??
/home/moslevin/mark3-source/embedded/stage/src/rand_lfsr.h	
Linear Feedback Shift Register based Pseudo-Random Number Generator	434
/home/moslevin/mark3-source/embedded/stage/src/scheduler.cpp	
Strict-Priority + Round-Robin thread scheduler implementation	435
/home/moslevin/mark3-source/embedded/stage/src/scheduler.h	
Thread scheduler function declarations	437
/home/moslevin/mark3-source/embedded/stage/src/screen.cpp	
Higher level window management framework	438
/home/moslevin/mark3-source/embedded/stage/src/screen.h	
Higher level window management framework	440
/home/moslevin/mark3-source/embedded/stage/src/shell_support.cpp	
Support functions & data structures useful in implementing a shell	441
/home/moslevin/mark3-source/embedded/stage/src/shell_support.h	
Support functions & data structures useful in implementing a shell	444
/home/moslevin/mark3-source/embedded/stage/src/size_report.h	??
/home/moslevin/mark3-source/embedded/stage/src/sizeprofile.h	??
/home/moslevin/mark3-source/embedded/stage/src/slip.cpp	
Serial Line IP framing code	446
/home/moslevin/mark3-source/embedded/stage/src/slip.h	
Serial Line IP framing code	450
/home/moslevin/mark3-source/embedded/stage/src/slip_mux.cpp	
FunkenSlip Channel Multiplexer	451
/home/moslevin/mark3-source/embedded/stage/src/slip_mux.h	
FunkenSlip Channel Multiplexer	453
/home/moslevin/mark3-source/embedded/stage/src/slipterm.cpp	
Serial debug interface using SLIP protocol, and FunkenSlip multiplexing	454
/home/moslevin/mark3-source/embedded/stage/src/slipterm.h	
Serial debug interface using SLIP serial, and Funkenslip serial port multiplexing	455
/home/moslevin/mark3-source/embedded/stage/src/system_heap.cpp	
Global system-heap implementation	456
/home/moslevin/mark3-source/embedded/stage/src/system_heap.h	
Global system-heap implementation	459
/home/moslevin/mark3-source/embedded/stage/src/system_heap_config.h	
System heap configuration - defines the block sizes and counts used to fulfill system/service allocations	463
/home/moslevin/mark3-source/embedded/stage/src/thread.cpp	
Platform-Independent thread class Definition	464
/home/moslevin/mark3-source/embedded/stage/src/thread.h	
Platform independent thread class declarations	469
/home/moslevin/mark3-source/embedded/stage/src/threadlist.cpp	
Thread linked-list definitions	472
/home/moslevin/mark3-source/embedded/stage/src/threadlist.h	
Thread linked-list declarations	473
/home/moslevin/mark3-source/embedded/stage/src/threadport.cpp	
ATMega328p Multithreading	475
/home/moslevin/mark3-source/embedded/stage/src/threadport.h	
ATMega328p Multithreading support	478
/home/moslevin/mark3-source/embedded/stage/src/tiles.cpp	??
/home/moslevin/mark3-source/embedded/stage/src/tiles.h	??
/home/moslevin/mark3-source/embedded/stage/src/timerlist.cpp	
Timer data structure + scheduler implementations	480
/home/moslevin/mark3-source/embedded/stage/src/timerlist.h	
Timer list and timer-scheduling declarations	485
/home/moslevin/mark3-source/embedded/stage/src/tracebuffer.cpp	
Kernel trace buffer class definition	487

/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">tracebuffer.h</a>	
<a href="#">Kernel</a> trace buffer class declaration . . . . .	488
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">transaction.cpp</a>	
<a href="#">Transaction</a> Queue Implementation . . . . .	489
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">transaction.h</a>	
<a href="#">Transaction</a> Queue Implementation . . . . .	490
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">unit_test.cpp</a>	
Unit test class definition . . . . .	492
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">unit_test.h</a>	
Unit test class declarations . . . . .	493
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">writebuf16.cpp</a>	
16 bit circular buffer implementation with callbacks . . . . .	495
/home/moslevin/mark3-source/embedded/stage/src/ <a href="#">writebuf16.h</a>	
Thread-safe circular buffer implementation with 16-bit elements . . . . .	497

# Chapter 16

## Class Documentation

### 16.1 Atomic Class Reference

The [Atomic](#) class.

```
#include <atomic.h>
```

#### Static Public Member Functions

- static K\_UCHAR [Set](#) (K\_UCHAR \*pucSource\_, K\_UCHAR ucVal\_)  
*Set Set a variable to a given value in an uninterruptable operation.*
- static K\_USHORT **Set** (K\_USHORT \*pusSource\_, K\_USHORT usVal\_)
- static K\_ULONG **Set** (K\_ULONG \*pulSource\_, K\_ULONG ulVal\_)
- static K\_UCHAR [Add](#) (K\_UCHAR \*pucSource\_, K\_UCHAR ucVal\_)  
*Add Add a value to a variable in an uninterruptable operation.*
- static K\_USHORT **Add** (K\_USHORT \*pusSource\_, K\_USHORT usVal\_)
- static K\_ULONG **Add** (K\_ULONG \*pulSource\_, K\_ULONG ulVal\_)
- static K\_UCHAR [Sub](#) (K\_UCHAR \*pucSource\_, K\_UCHAR ucVal\_)  
*Sub Subtract a value from a variable in an uninterruptable operation.*
- static K\_USHORT **Sub** (K\_USHORT \*pusSource\_, K\_USHORT usVal\_)
- static K\_ULONG **Sub** (K\_ULONG \*pulSource\_, K\_ULONG ulVal\_)
- static K\_BOOL [TestAndSet](#) (K\_BOOL \*pbLock)  
*TestAndSet Test to see if a variable is set, and set it if is not already set.*

#### 16.1.1 Detailed Description

The [Atomic](#) class.

This utility class provides primitives for atomic operations - that is, operations that are guaranteed to execute uninterrupted. Basic atomic primitives provided here include Set/Add/Delete for 8, 16, and 32-bit integer types, as well as an atomic test-and-set.

Definition at line 39 of file [atomic.h](#).

#### 16.1.2 Member Function Documentation

##### 16.1.2.1 K\_UCHAR Atomic::Add ( K\_UCHAR \* *pucSource\_*, K\_UCHAR *ucVal\_* ) [static]

Add Add a value to a variable in an uninterruptable operation.

## Parameters

<i>pucSource_</i>	Pointer to a variable
<i>ucVal_</i>	Value to add to the variable

## Returns

Previously-held value in *pucSource\_*

Definition at line 60 of file [atomic.cpp](#).

16.1.2.2 `K_UCHAR Atomic::Set ( K_UCHAR * pucSource_, K_UCHAR ucVal_ ) [static]`

Set Set a variable to a given value in an uninterruptable operation.

## Parameters

<i>pucSource_</i>	Pointer to a variable to set the value of
<i>ucVal_</i>	New value to set in the variable

## Returns

Previously-set value

Definition at line 29 of file [atomic.cpp](#).

16.1.2.3 `K_UCHAR Atomic::Sub ( K_UCHAR * pucSource_, K_UCHAR ucVal_ ) [static]`

Sub Subtract a value from a variable in an uninterruptable operation.

## Parameters

<i>pucSource_</i>	Pointer to a variable
<i>ucVal_</i>	Value to subtract from the variable

## Returns

Previously-held value in *pucSource\_*

Definition at line 93 of file [atomic.cpp](#).

16.1.2.4 `K_BOOL Atomic::TestAndSet ( K_BOOL * pbLock ) [static]`

TestAndSet Test to see if a variable is set, and set it if is not already set.

This is an uninterruptable operation.

If the value is false, set the variable to true, and return the previously-held value.

If the value is already true, return true.

## Parameters

<i>pbLock</i>	Pointer to a value to test against. This will always be set to "true" at the end of a call to TestAndSet.
---------------	---

## Returns

true - Lock value was "true" on entry, false - Lock was set

Definition at line 126 of file [atomic.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/atomic.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/atomic.cpp](#)

## 16.2 BitStreamer Class Reference

### Public Member Functions

- void [Init](#) (K\_UCHAR \*pucData\_, K\_USHORT usSize\_)  
*Init.*
- void [AdvanceByte](#) (void)  
*AdvanceByte.*
- K\_UCHAR [ReadBits](#) (K\_UCHAR ucNumBits\_)  
*ReadBits.*

### Private Attributes

- K\_UCHAR \* [m\\_pucData](#)  
*Pointer to the data being streamed.*
- K\_UCHAR [m\\_ucBitIndex](#)  
*Current "bit" index in the current byte.*
- K\_USHORT [m\\_usByteIndex](#)  
*Current "byte" index in the stream.*
- K\_USHORT [m\\_usSize](#)  
*Length of data (in bytes)*

### 16.2.1 Detailed Description

Definition at line 21 of file [bitstream.h](#).

### 16.2.2 Member Function Documentation

#### 16.2.2.1 void BitStreamer::AdvanceByte ( void )

*AdvanceByte.*

Advance byte index to the next full byte if the current bit index is non-zero. If the current bit index is zero, no action is taken. This is used to byte-align 2-dimensional data, such as images.

Definition at line 28 of file [bitstream.cpp](#).

#### 16.2.2.2 void BitStreamer::Init ( K\_UCHAR \* pucData\_, K\_USHORT usSize\_ )

*Init.*

Initialize the [BitStreamer](#) object prior to use

**Parameters**

<i>pucData_</i>	Pointer to raw data to be streamed
<i>usSize_</i>	Size of pucData_ in bytes

Definition at line 19 of file [bitstream.cpp](#).

**16.2.2.3 K\_UCHAR BitStreamer::ReadBits ( K\_UCHAR ucNumBits\_ )**

ReadBits.

Read the next "n" bits from the stream, returning the result into an 8-bit unsigned integer.

**Parameters**

<i>ucNumBits_</i>	Number of bits to read (less than 8)
-------------------	--------------------------------------

**Returns**

Bits read as an 8-bit unsigned integer.

Definition at line 38 of file [bitstream.cpp](#).

The documentation for this class was generated from the following files:

- /home/moslevin/mark3-source/embedded/stage/src/bitstream.h
- /home/moslevin/mark3-source/embedded/stage/src/bitstream.cpp

**16.3 BlockHeap Class Reference**

Single-block-size heap.

```
#include <fixed_heap.h>
```

**Public Member Functions**

- void \* [Create](#) (void \*pvHeap\_, K\_USHORT usSize\_, K\_USHORT usBlockSize\_)  
*Create a single list heap in the blob of memory provided, with the selected heap size, and the selected number of blocks.*
- void \* [Alloc](#) ()  
*Allocate a block of memory from this heap.*
- void [Free](#) (void \*pvData\_)  
*Free a previously allocated block of memory.*
- K\_BOOL [IsFree](#) ()  
*Returns the state of a heap - whether or not it has free elements.*

**Protected Attributes**

- K\_USHORT [m\\_usBlocksFree](#)  
*Number of blocks free in the heap.*

**Private Attributes**

- [DoubleLinkedList m\\_clList](#)  
*Linked list used to manage the blocks.*

### 16.3.1 Detailed Description

Single-block-size heap.

Definition at line 29 of file [fixed\\_heap.h](#).

### 16.3.2 Member Function Documentation

#### 16.3.2.1 void \* BlockHeap::Alloc ( )

Allocate a block of memory from this heap.

##### Returns

pointer to a block of memory, or 0 on failure

Definition at line 83 of file [fixed\\_heap.cpp](#).

#### 16.3.2.2 void \* BlockHeap::Create ( void \* pvHeap\_, K\_USHORT usSize\_, K\_USHORT usBlockSize\_ )

Create a single list heap in the blob of memory provided, with the selected heap size, and the selected number of blocks.

Will create as many blocks as will fit in the usSize\_ parameter

##### Parameters

<i>pvHeap_</i>	Pointer to the heap data to initialize
<i>usSize_</i>	Size of the heap range in bytes
<i>usBlockSize_</i>	Size of each heap block in bytes

##### Returns

Pointer to the next heap element to initialize

Definition at line 48 of file [fixed\\_heap.cpp](#).

#### 16.3.2.3 void BlockHeap::Free ( void \* pvData\_ )

Free a previously allocated block of memory.

##### Parameters

<i>pvData_</i>	Pointer to a block of data previously allocated off the heap.
----------------	---

Definition at line 102 of file [fixed\\_heap.cpp](#).

#### 16.3.2.4 K\_BOOL BlockHeap::IsFree ( ) [inline]

Returns the state of a heap - whether or not it has free elements.

##### Returns

true if the heap is not full, false if the heap is full

Definition at line 74 of file [fixed\\_heap.h](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/fixed\\_heap.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/fixed\\_heap.cpp](#)

## 16.4 BlockingObject Class Reference

Class implementing thread-blocking primitives.

```
#include <blocking.h>
```

Inheritance diagram for BlockingObject:

### Protected Member Functions

- void **Block** (**Thread** \*pciThread\_)
- void **UnBlock** (**Thread** \*pciThread\_)
- K\_UCHAR **UnLock** ()  
*Unlock.*
- K\_BOOL **LockAndQueue** (K\_USHORT usCode\_, void \*pvData\_, K\_BOOL \*pbSchedState\_)  
*LockAndQueue.*

### Protected Attributes

- **ThreadList** m\_clBlockList  
*ThreadList which is used to hold the list of threads blocked on a given object.*
- **TransactionQueue** m\_clKTQ  
*Kernel Transaction Queue used to serialize acceses to this blocking object.*
- K\_UCHAR m\_ucLocks  
*The current count of locks held by this blocking object.*

### 16.4.1 Detailed Description

Class implementing thread-blocking primitives.

Used for implementing things like semaphores, mutexes, message queues, or anything else that could cause a thread to suspend execution on some external stimulus.

Definition at line 67 of file [blocking.h](#).

### 16.4.2 Member Function Documentation

#### 16.4.2.1 void BlockingObject::Block ( Thread \* pciThread\_ ) [protected]

##### Parameters

<i>pciThread_</i>	Pointer to the thread object that will be blocked.
-------------------	--

Blocks a thread on this object. This is the fundamental operation performed by any sort of blocking operation in the operating system. All semaphores/mutexes/sleeping/messaging/etc ends up going through the blocking code at some point as part of the code that manages a transition from an "active" or "waiting" thread to a "blocked" thread.

The steps involved in blocking a thread (which are performed in the function itself) are as follows;

1) Remove the specified thread from the current owner's list (which is likely one of the scheduler's thread lists) 2) Add the thread to this object's thread list 3) Setting the thread's "current thread-list" point to reference this object's threadlist.

Definition at line 36 of file [blocking.cpp](#).

**16.4.2.2** `K_BOOL BlockingObject::LockAndQueue ( K_USHORT usCode_, void * pvData_, K_BOOL * pbSchedState_ )`  
[protected]

LockAndQueue.

Lock the object and enqueue data on its transaction queue. If the object is already locked, enqueue the data and return back. Otherwise, disable the scheduler and return its state in addition to enqueueing the given transaction

Parameters

<i>usCode_</i>	Transaction code value
<i>pvData_</i>	Abstract transaction data pointer
<i>pbSchedState_</i>	Pointer to a flag used to store the scheduler's original state.

Returns

true - Object was previously locked, false - object was not previously locked.

Definition at line 87 of file [blocking.cpp](#).

**16.4.2.3** `void BlockingObject::UnBlock ( Thread * pclThread_ )` [protected]

Parameters

<i>pclThread_</i>	Pointer to the thread to unblock.
-------------------	-----------------------------------

Unblock a thread that is already blocked on this object, returning it to the "ready" state by performing the following steps:

1) Removing the thread from this object's threadlist 2) Restoring the thread to its "original" owner's list

Definition at line 54 of file [blocking.cpp](#).

**16.4.2.4** `K_UCHAR BlockingObject::UnLock ( )` [protected]

Unlock.

See Also

Lock

Returns

Count of pending locks held on this blocking object

This function will atomically-decrement the internal lock count held on the object, returning the new lock count value.

Definition at line 73 of file [blocking.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/blocking.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/blocking.cpp](#)

## 16.5 ButtonControl Class Reference

Inheritance diagram for ButtonControl:

### Public Member Functions

- virtual void [Init](#) ()  
*Initialize the control - must be called before use.*
- virtual void [Draw](#) ()  
*Redraw the control "cleanly".*
- virtual [GuiReturn\\_t](#) [ProcessEvent](#) ([GuiEvent\\_t](#) \*pstEvent\_)  
*Process an event sent to the control.*
- virtual void [Activate](#) (bool bActivate\_)  
*Activate or deactivate the current control - used when switching from one active control to another.*
- void [SetBGColor](#) (COLOR eColor\_)
- void [SetLineColor](#) (COLOR eColor\_)
- void [SetFillColor](#) (COLOR eColor\_)
- void [SetTextColor](#) (COLOR eColor\_)
- void [SetActiveColor](#) (COLOR eColor\_)
- void [SetFont](#) ([Font\\_t](#) \*pstFont\_)
- void [SetCaption](#) (const K\_CHAR \*szCaption\_)
- void [SetCallback](#) (ButtonCallback pfCallback\_, void \*pvData\_)

### Private Attributes

- const K\_CHAR \* [m\\_szCaption](#)
- [Font\\_t](#) \* [m\\_pstFont](#)
- COLOR [m\\_uBGColor](#)
- COLOR [m\\_uActiveColor](#)
- COLOR [m\\_uLineColor](#)
- COLOR [m\\_uFillColor](#)
- COLOR [m\\_uTextColor](#)
- bool [m\\_bState](#)
- void \* [m\\_pvCallbackData](#)
- ButtonCallback [m\\_pfCallback](#)

### Additional Inherited Members

#### 16.5.1 Detailed Description

Definition at line 32 of file [control\\_button.h](#).

## 16.5.2 Member Function Documentation

### 16.5.2.1 void ButtonControl::Activate ( bool *bActivate\_* ) [virtual]

Activate or deactivate the current control - used when switching from one active control to another.

## Parameters

<i>bActivate_</i>	- true to activate, false to deactivate
-------------------	---

Implements [GuiControl](#).

Definition at line 215 of file [control\\_button.cpp](#).

#### 16.5.2.2 void ButtonControl::Draw ( ) [virtual]

Redraw the control "cleanly".

Subclass specific.

Implements [GuiControl](#).

Definition at line 39 of file [control\\_button.cpp](#).

#### 16.5.2.3 void ButtonControl::Init ( ) [virtual]

Initialize the control - must be called before use.

Implementation is subclass specific.

Implements [GuiControl](#).

Definition at line 25 of file [control\\_button.cpp](#).

#### 16.5.2.4 GuiReturn\_t ButtonControl::ProcessEvent ( GuiEvent\_t \* *pstEvent\_* ) [virtual]

Process an event sent to the control.

Subclass specific implementation.

## Parameters

<i>pstEvent_</i>	Pointer to a struct containing the event data
------------------	---

Implements [GuiControl](#).

Definition at line 117 of file [control\\_button.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/control\\_button.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/control\\_button.cpp](#)

## 16.6 CheckBoxControl Class Reference

Inheritance diagram for CheckBoxControl:

## Public Member Functions

- virtual void [Init](#) ()  
*Initialiize the control - must be called before use.*
- virtual void [Draw](#) ()  
*Redraw the control "cleanly".*

## Additional Inherited Members

### 16.6.1 Detailed Description

Definition at line 29 of file [control\\_checkbox.h](#).

### 16.6.2 Member Function Documentation

16.6.2.1 virtual void [CheckBoxControl::Activate](#) ( bool *bActivate\_* ) [inline],[virtual]

Activate or deactivate the current control - used when switching from one active control to another.

Parameters

<i>bActivate_</i>	- true to activate, false to deactivate
-------------------	---

Implements [GuiControl](#).

Definition at line 35 of file [control\\_checkbox.h](#).

16.6.2.2 void [CheckBoxControl::Draw](#) ( ) [virtual]

Redraw the control "cleanly".

Subclass specific.

Implements [GuiControl](#).

Definition at line 59 of file [control\\_checkbox.cpp](#).

### 16.6.2.3 void CheckBoxControl::Init ( ) [virtual]

Initialize the control - must be called before use.

Implementation is subclass specific.

Implements [GuiControl](#).

Definition at line 53 of file [control\\_checkbox.cpp](#).

### 16.6.2.4 GuiReturn\_t CheckBoxControl::ProcessEvent ( GuiEvent\_t \* pstEvent\_ ) [virtual]

Process an event sent to the control.

Subclass specific implementation.

#### Parameters

<i>pstEvent_</i>	Pointer to a struct containing the event data
------------------	---

Implements [GuiControl](#).

Definition at line 130 of file [control\\_checkbox.cpp](#).

The documentation for this class was generated from the following files:

- /home/moslevin/mark3-source/embedded/stage/src/[control\\_checkbox.h](#)
- /home/moslevin/mark3-source/embedded/stage/src/[control\\_checkbox.cpp](#)

## 16.7 CircularLinkedList Class Reference

Circular-linked-list data type, inherited from the base [LinkList](#) type.

```
#include <ll.h>
```

Inheritance diagram for CircularLinkedList:

### Public Member Functions

- virtual void [Add](#) ([LinkListNode](#) \*node\_)  
*Add the linked list node to this linked list.*
- virtual void [Remove](#) ([LinkListNode](#) \*node\_)  
*Add the linked list node to this linked list.*
- void [PivotForward](#) ()  
*Pivot the head of the circularly linked list forward ( Head = Head->next, Tail = Tail->next )*
- void [PivotBackward](#) ()  
*Pivot the head of the circularly linked list backward ( Head = Head->prev, Tail = Tail->prev )*

## Additional Inherited Members

### 16.7.1 Detailed Description

Circular-linked-list data type, inherited from the base [LinkedList](#) type.

Definition at line 197 of file [ll.h](#).

### 16.7.2 Member Function Documentation

#### 16.7.2.1 void CircularLinkedList::Add ( [LinkedListNode](#) \* *node\_* ) [virtual]

Add the linked list node to this linked list.

Parameters

<i>node_</i>	Pointer to the node to add
--------------	----------------------------

Implements [LinkedList](#).

Reimplemented in [ThreadList](#).

Definition at line 102 of file [ll.cpp](#).

#### 16.7.2.2 void CircularLinkedList::Remove ( [LinkedListNode](#) \* *node\_* ) [virtual]

Add the linked list node to this linked list.

Parameters

<i>node_</i>	Pointer to the node to remove
--------------	-------------------------------

Implements [LinkedList](#).

Reimplemented in [ThreadList](#).

Definition at line 127 of file [ll.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/ll.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/ll.cpp](#)

## 16.8 CommandLine\_t Struct Reference

Structure containing multiple representations for command-line data.

```
#include <shell_support.h>
```

### Public Attributes

- [Token\\_t](#) \* [pastTokenList](#)  
*Pointer to the list of tokens in the commandline.*
- K\_UCHAR [ucTokenCount](#)  
*Count of tokens in the token list.*
- [Token\\_t](#) \* [pstCommand](#)  
*Pointer to the token corresponding to the shell command.*
- [Option\\_t](#) [astOptions](#) [12]  
*Option strucure array built from the token list.*

- K\_UCHAR [ucNumOptions](#)

*Number of options parsed from the token list.*

### 16.8.1 Detailed Description

Structure containing multiple representations for command-line data.

Definition at line 93 of file [shell\\_support.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/shell\\_support.h](#)

## 16.9 DCPU Class Reference

**DCPU** emulator, used for running code out of EEPROM, RAM, or other memory interfaces than FLASH.

```
#include <dcpu.h>
```

### Public Member Functions

- void [Init](#) (K\_USHORT \*pusRAM\_, K\_USHORT usRAMSize\_, const K\_USHORT \*pusROM\_, K\_USHORT usROMSize\_)  
*Initialize the CPU emulator, specifying which driver supplies the memory read interface.*
- void [RunOpcode](#) ()  
*Execute the next opcode at the VM's current PC.*
- [DCPU\\_Registers](#) \* [GetRegisters](#) ()  
*Return a pointer to the VM's register structure.*
- void [SendInterrupt](#) (K\_USHORT usMessage\_)  
*Send an interrupt to the CPU with a given message.*
- void [AddPlugin](#) ([DCPUPlugin](#) \*pclPlugin\_)  
*Add a plugin to the CPU.*

### Private Member Functions

- K\_USHORT **m\_usROMSize**  
*Size of the ROM.*
- K\_ULONG **m\_ulCycleCount**  
*Current cycle count.*
- K\_BOOL **m\_bInterruptQueueing**  
*CPU flag indicating whether or not interrupts are queued.*
- K\_UCHAR **m\_ucQueueLevel**  
*Current interrupt Queue level.*
- K\_USHORT **m\_ausInterruptQueue** [8]  
*Interrupt queue.*
- **DoubleLinkedList m\_clPluginList**  
*Linked-list of plug-ins.*

### 16.9.1 Detailed Description

DCPU emulator, used for running code out of EEPROM, RAM, or other memory interfaces than FLASH.

Definition at line 359 of file [dcpu.h](#).

### 16.9.2 Member Function Documentation

#### 16.9.2.1 void DCPU::AddPlugin ( DCPUPlugin \* *pciPlugin\_* )

Add a plugin to the CPU.

Parameters

<i>pciPlugin_</i>	Pointer to the plugin object to add
-------------------	-------------------------------------

Definition at line 948 of file [dcpu.cpp](#).

#### 16.9.2.2 K\_UCHAR DCPU::GetOperand ( K\_UCHAR *ucOpType\_*, K\_USHORT \*\* *pusResult\_* ) [private]

Parameters

<i>ucOpType_</i>	The operand type, as specified in DCPU_Argument
<i>pusResult_</i>	Pointer to the pointer that corresponds to the argument's location in memory.

Definition at line 722 of file [dcpu.cpp](#).

#### 16.9.2.3 DCPU\_Registers \* DCPU::GetRegisters ( ) [inline]

Return a pointer to the VM's register structure.

Returns

Pointer to the VM's register structure

Definition at line 391 of file [dcpu.h](#).

#### 16.9.2.4 void DCPU::HWN ( ) [private]

Returns the number of connected hardware devices to "a"

Definition at line 642 of file [dcpu.cpp](#).

#### 16.9.2.5 void DCPU::IAQ ( ) [private]

Add an interrupt to the interrupt queue if non-zero, if a = 0 then interrupts will be triggered as normal

Interrupts queued

Interrupts triggered

Definition at line 624 of file [dcpu.cpp](#).

#### 16.9.2.6 void DCPU::Init ( K\_USHORT \* *pusRAM\_*, K\_USHORT *usRAMSize\_*, const K\_USHORT \* *pusROM\_*, K\_USHORT *usROMSize\_* )

Initialize the CPU emulator, specifying which driver supplies the memory read interface.

This allows us to abstract RAM/FLASH/EEPROM or other memory. The VM must be initialized before any other method in the class is run.

**Parameters**

<i>pusRAM_</i>	Pointer to the CPU's RAM buffer
<i>usRAMSize_</i>	Size of the RAM Buffer in words
<i>pusROM_</i>	Pointer to the CPU's ROM buffer
<i>usROMSize_</i>	Size of the ROM buffer in words

Definition at line 697 of file [dcpu.cpp](#).

**16.9.2.7 void DCPU::RFI( ) [private]**

Disables interrupt queueing, pop A from the stack, then pops PC from the stack. By disabling interrupt Queueing, we're essentially re-enabling interrupts.

Definition at line 609 of file [dcpu.cpp](#).

**16.9.2.8 void DCPU::SendInterrupt ( K\_USHORT usMessage\_ )**

Send an interrupt to the CPU with a given message.

**Parameters**

<i>usMessage_</i>	<a href="#">Message</a> to send along with the interrupt
-------------------	--

Definition at line 922 of file [dcpu.cpp](#).

**16.9.3 Member Data Documentation****16.9.3.1 DoubleLinkedList DCPU::m\_clPluginList [private]**

Linked-list of plug-ins.

Definition at line 489 of file [dcpu.h](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/dcpu.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/dcpu.cpp](#)

**16.10 DCPU\_Registers Struct Reference**

Structure defining the [DCPU](#) hardware registers.

```
#include <dcpu.h>
```

**Public Attributes****16.10.1 Detailed Description**

Structure defining the [DCPU](#) hardware registers.

Definition at line 72 of file [dcpu.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/dcpu.h](#)

## 16.11 DCPUPlugin Class Reference

Class used to provide the hardware device abstraction between the DCPU-16 emulator/VM and the host system.

```
#include <dcpu.h>
```

Inheritance diagram for DCPUPlugin:

### Public Member Functions

- void [Init](#) (K\_USHORT usDeviceNumber\_, K\_ULONG ulHWID\_, K\_ULONG ulVID\_, K\_USHORT usVersion\_, [DCPU\\_Callback](#) pfCallback\_)  
*Initialize the [DCPU](#) plugin extension.*
- void [Enumerate](#) ([DCPU\\_Registers](#) \*pstRegisters\_)  
*Perform hardware enumeration to the target VM specified by the register set.*
- void [Interrupt](#) ([DCPU](#) \*pclCPU\_)  
*Execute the hardware callback.*
- K\_USHORT [GetDeviceNumber](#) ()  
*Return the device number associated with this plugin.*

### Private Attributes

- K\_USHORT [m\\_usDeviceNumber](#)  
*Location of the device on the "bus".*
- K\_ULONG [m\\_ulHWID](#)  
*Hardware ID.*
- K\_ULONG [m\\_ulVID](#)  
*Vendor ID.*
- K\_USHORT [m\\_usVersion](#)  
*Hardware Version.*
- [DCPU\\_Callback](#) [m\\_pfCallback](#)  
*HWI Callback.*

### Friends

- class [DCPUPluginList](#)

### Additional Inherited Members

#### 16.11.1 Detailed Description

Class used to provide the hardware device abstraction between the DCPU-16 emulator/VM and the host system.

Definition at line 267 of file [dcpu.h](#).

### 16.11.2 Member Function Documentation

16.11.2.1 void DCPUPugin::Enumerate ( DCPU\_Registers \* *pstRegisters\_* ) [inline]

Perform hardware enumeration to the target VM specified by the register set.

## Parameters

<i>pstRegisters_</i>	Pointer to the VM's CPU registers, which are filled with enumeration data. See the <a href="#">DCPU 1.7 spec</a> for details.
----------------------	---

Definition at line 311 of file [dcpu.h](#).

#### 16.11.2.2 K\_USHORT DCPUPugin::GetDeviceNumber ( ) [inline]

Return the device number associated with this plugin.

## Returns

Device number associated with this plugin

Definition at line 339 of file [dcpu.h](#).

#### 16.11.2.3 void DCPUPugin::Init ( K\_USHORT usDeviceNumber\_, K\_ULONG ulHWID\_, K\_ULONG ulVID\_, K\_USHORT usVersion\_, DCPU\_Callback pfCallback\_ ) [inline]

Initialize the [DCPU](#) plugin extension.

## Plug

## Parameters

<i>usDevice-Number_</i>	Unique plugin device enumeration associated with this plugin
<i>ulHWID_</i>	Unique hardware type identifier
<i>ulVID_</i>	Hardware Vendor ID
<i>usVersion_</i>	Version identifier for this hardware piece
<i>pfCallback_</i>	Callback function invoked from the VM when a HWI instruction is called on this device. This is essentially the interrupt handler.

Definition at line 288 of file [dcpu.h](#).

#### 16.11.2.4 void DCPUPugin::Interrupt ( DCPU \* pcICPU\_ ) [inline]

Execute the hardware callback.

## Parameters

<i>pcICPU_</i>	Pointer to the VM triggering the interrupt
----------------	--

Definition at line 327 of file [dcpu.h](#).

The documentation for this class was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/dcpu.h](#)

## 16.12 DevNull Class Reference

This class implements the "default" driver (/dev/null)

Inheritance diagram for DevNull:

## Public Member Functions

- virtual void [Init](#) ()  
*Initialize a driver, must be called prior to use.*
- virtual K\_UCHAR [Open](#) ()  
*Open a device driver prior to use.*
- virtual K\_UCHAR [Close](#) ()  
*Close a previously-opened device driver.*
- virtual K\_USHORT [Read](#) (K\_USHORT usBytes\_, K\_UCHAR \*pucData\_)  
*Read a specified number of bytes from the device into a specific buffer.*
- virtual K\_USHORT [Write](#) (K\_USHORT usBytes\_, K\_UCHAR \*pucData\_)  
*Write a payload of data of a given length to the device.*
- virtual K\_USHORT [Control](#) (K\_USHORT usEvent\_, void \*pvDataIn\_, K\_USHORT usSizeIn\_, void \*pvDataOut\_, K\_USHORT usSizeOut\_)  
*This is the main entry-point for device-specific io and control operations.*

## Additional Inherited Members

### 16.12.1 Detailed Description

This class implements the "default" driver (/dev/null)

Definition at line 40 of file [driver.cpp](#).

### 16.12.2 Member Function Documentation

#### 16.12.2.1 virtual K\_UCHAR DevNull::Close ( ) [inline],[virtual]

Close a previously-opened device driver.

#### Returns

Driver-specific return code, 0 = OK, non-0 = error

Implements [Driver](#).

Definition at line 45 of file [driver.cpp](#).

#### 16.12.2.2 virtual K\_USHORT DevNull::Control ( K\_USHORT usEvent\_, void \* pvDataIn\_, K\_USHORT usSizeIn\_, void \* pvDataOut\_, K\_USHORT usSizeOut\_ ) [inline],[virtual]

This is the main entry-point for device-specific io and control operations.

This is used for implementing all "side-channel" communications with a device, and any device-specific IO operations that do not conform to the typical POSIX read/write paradigm. Use of this function is analogous to the non-POSIX (yet still common) `devctl()` or `ioctl()`.

## Parameters

<i>usEvent_</i>	Code defining the io event (driver-specific)
<i>pvDataIn_</i>	Pointer to the input data
<i>usSizeIn_</i>	Size of the input data (in bytes)
<i>pvDataOut_</i>	Pointer to the output data
<i>usSizeOut_</i>	Size of the output data (in bytes)

## Returns

Driver-specific return code, 0 = OK, non-0 = error

Implements [Driver](#).

Definition at line 53 of file [driver.cpp](#).

16.12.2.3 `virtual K_UCHAR DevNull::Open ( ) [inline],[virtual]`

Open a device driver prior to use.

## Returns

Driver-specific return code, 0 = OK, non-0 = error

Implements [Driver](#).

Definition at line 44 of file [driver.cpp](#).

16.12.2.4 `virtual K_USHORT DevNull::Read ( K_USHORT usBytes_, K_UCHAR * pucData_ ) [inline],[virtual]`

Read a specified number of bytes from the device into a specific buffer.

Depending on the driver-specific implementation, this may be a number less than the requested number of bytes read, indicating that there was less input than desired, or that as a result of buffering, the data may not be available.

## Parameters

<i>usBytes_</i>	Number of bytes to read (<= size of the buffer)
<i>pucData_</i>	Pointer to a data buffer receiving the read data

## Returns

Number of bytes actually read

Implements [Driver](#).

Definition at line 47 of file [driver.cpp](#).

16.12.2.5 `virtual K_USHORT DevNull::Write ( K_USHORT usBytes_, K_UCHAR * pucData_ ) [inline],[virtual]`

Write a payload of data of a given length to the device.

Depending on the implementation of the driver, the amount of data written to the device may be less than the requested number of bytes. A result less than the requested size may indicate that the device buffer is full, indicating that the user must retry the write at a later point with the remaining data.

## Parameters

<i>usBytes_</i>	Number of bytes to write ( $\leq$ size of the buffer)
<i>pucData_</i>	Pointer to a data buffer containing the data to write

## Returns

Number of bytes actually written

Implements [Driver](#).

Definition at line 50 of file [driver.cpp](#).

The documentation for this class was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/driver.cpp](#)

## 16.13 DoubleLinkedList Class Reference

Doubly-linked-list data type, inherited from the base [LinkedList](#) type.

```
#include <ll.h>
```

Inheritance diagram for DoubleLinkedList:

### Public Member Functions

- [DoubleLinkedList](#) ()  
*Default constructor - initializes the head/tail nodes to NULL.*
- virtual void [Add](#) ([LinkedListNode](#) \*node\_)  
*Add the linked list node to this linked list.*
- virtual void [Remove](#) ([LinkedListNode](#) \*node\_)  
*Add the linked list node to this linked list.*

### Additional Inherited Members

#### 16.13.1 Detailed Description

Doubly-linked-list data type, inherited from the base [LinkedList](#) type.

Definition at line 166 of file [ll.h](#).

#### 16.13.2 Member Function Documentation

16.13.2.1 void [DoubleLinkedList::Add](#) ( [LinkedListNode](#) \* node\_ ) [virtual]

Add the linked list node to this linked list.

## Parameters

<i>node_</i>	Pointer to the node to add
--------------	----------------------------

Implements [LinkedList](#).

Definition at line 41 of file [ll.cpp](#).

16.13.2.2 void DoubleLinkedList::Remove ( [LinkedListNode](#) \* *node\_* ) [virtual]

Add the linked list node to this linked list.

## Parameters

<i>node_</i>	Pointer to the node to remove
--------------	-------------------------------

Implements [LinkedList](#).

Definition at line 65 of file [ll.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/ll.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/ll.cpp](#)

## 16.14 DrawBitmap\_t Struct Reference

Defines a bitmap.

```
#include <draw.h>
```

## Public Attributes

- [K\\_USHORT](#) [usX](#)  
*Leftmost pixel.*
- [K\\_USHORT](#) [usY](#)  
*Uppermost pixel.*
- [K\\_USHORT](#) [usWidth](#)  
*Width of the bitmap in pixels.*
- [K\\_USHORT](#) [usHeight](#)  
*Height of the bitmap in pixels.*
- [K\\_UCHAR](#) [ucBPP](#)  
*Bits-per-pixel.*
- [K\\_UCHAR](#) \* [pucData](#)  
*Pixel data pointer.*

### 16.14.1 Detailed Description

Defines a bitmap.

Definition at line 117 of file [draw.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/draw.h](#)

## 16.15 DrawCircle\_t Struct Reference

Defines a circle.

```
#include <draw.h>
```

### Public Attributes

- K\_USHORT [usX](#)  
*Center X pixel.*
- K\_USHORT [usY](#)  
*Center Y pixel.*
- K\_USHORT [usRadius](#)  
*Radius in pixels.*
- COLOR [uLineColor](#)  
*Color of the circle perimeter.*
- K\_BOOL [bFill](#)  
*Whether or not to fill the interior of the circle.*
- COLOR [uFillColor](#)  
*Fill color for the circle.*

### 16.15.1 Detailed Description

Defines a circle.

Definition at line 92 of file [draw.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/draw.h](#)

## 16.16 DrawEllipse\_t Struct Reference

Defines a ellipse.

```
#include <draw.h>
```

### Public Attributes

- K\_USHORT [usX](#)  
*Center X pixel.*
- K\_USHORT [usY](#)  
*Center Y pixel.*
- K\_USHORT [usHeight](#)  
*Height of the ellipse.*
- K\_USHORT [usWidth](#)  
*Width of the ellipse.*
- COLOR [uColor](#)  
*Color of the ellipse perimeter.*

### 16.16.1 Detailed Description

Defines a ellipse.

Definition at line 105 of file [draw.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/draw.h](#)

## 16.17 DrawLine\_t Struct Reference

Defines a simple line.

```
#include <draw.h>
```

### Public Attributes

- K\_USHORT [usX1](#)  
*Starting X coordinate.*
- K\_USHORT [usX2](#)  
*Ending X coordinate.*
- K\_USHORT [usY1](#)  
*Starting Y Coordinate.*
- K\_USHORT [usY2](#)  
*Ending Y coordinate.*
- COLOR [uColor](#)  
*Color of the pixel.*

### 16.17.1 Detailed Description

Defines a simple line.

Definition at line 66 of file [draw.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/draw.h](#)

## 16.18 DrawMove\_t Struct Reference

Simple 2D copy/paste.

```
#include <draw.h>
```

### Public Attributes

- K\_USHORT [usSrcX](#)  
*Source X pixel (leftmost)*
- K\_USHORT [usSrcY](#)  
*Source Y pixel (topmost)*
- K\_USHORT [usDstX](#)  
*Destination X pixel (leftmost)*

- K\_USHORT [usDstY](#)  
*Destination Y pixel (topmost)*
- K\_USHORT [usCopyHeight](#)  
*Number of rows to copy.*
- K\_USHORT [usCopyWidth](#)  
*Number of columns to copy.*

### 16.18.1 Detailed Description

Simple 2D copy/paste.

Moves a bitmap specified by the given source coordinates on-surface to the destination coordinates.

Definition at line 188 of file [draw.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/draw.h](#)

## 16.19 DrawPoint\_t Struct Reference

Defines a pixel.

```
#include <draw.h>
```

### Public Attributes

- K\_USHORT [usX](#)  
*X coordinate of the pixel.*
- K\_USHORT [usY](#)  
*Y coordinate of the pixel.*
- COLOR [uColor](#)  
*Color of the pixel.*

### 16.19.1 Detailed Description

Defines a pixel.

Definition at line 55 of file [draw.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/draw.h](#)

## 16.20 DrawPoly\_t Struct Reference

Defines the structure of an arbitrary polygon.

```
#include <draw.h>
```

## Public Attributes

- K\_USHORT [usNumPoints](#)  
*Number of points in the polygon.*
- COLOR [uColor](#)  
*Color to use for lines/fill.*
- K\_BOOL [bFill](#)  
*Display as wireframe or filled.*
- [DrawVector\\_t](#) \* [pstVector](#)  
*Vector points making the polygon.*

### 16.20.1 Detailed Description

Defines the structure of an arbitrary polygon.

Can be used to specify the

Definition at line 215 of file [draw.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/draw.h](#)

## 16.21 DrawRectangle\_t Struct Reference

Defines a rectangle.

```
#include <draw.h>
```

## Public Attributes

- K\_USHORT [usLeft](#)  
*Leftmost pixel of the rectangle.*
- K\_USHORT [usTop](#)  
*Topmost pixel of the rectangle.*
- K\_USHORT [usRight](#)  
*Rightmost pixel of the rectangle.*
- K\_USHORT [usBottom](#)  
*Bottom pixel of the rectangle.*
- COLOR [uLineColor](#)  
*Color of the line.*
- K\_BOOL [bFill](#)  
*Whether or not to floodfill the interior.*
- COLOR [uFillColor](#)  
*Color of the interior of the rectangle.*

### 16.21.1 Detailed Description

Defines a rectangle.

Definition at line 78 of file [draw.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/draw.h](#)

## 16.22 DrawStamp\_t Struct Reference

Defines a 1-bit 2D bitmap of arbitrary resolution.

```
#include <draw.h>
```

### Public Attributes

- K\_USHORT [usX](#)  
*Leftmost pixel.*
- K\_USHORT [usY](#)  
*Uppermost pixel.*
- K\_USHORT [usWidth](#)  
*Width of the stamp.*
- K\_USHORT [usHeight](#)  
*Height of the stamp.*
- COLOR [uColor](#)  
*Color of the stamp.*
- K\_UCHAR \* [pucData](#)  
*Pointer to the stamp data.*

### 16.22.1 Detailed Description

Defines a 1-bit 2D bitmap of arbitrary resolution.

Definition at line [130](#) of file [draw.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/draw.h](#)

## 16.23 DrawText\_t Struct Reference

Defines a bitmap-rendered string.

```
#include <draw.h>
```

### Public Attributes

- K\_USHORT [usLeft](#)  
*Leftmost pixel of the text.*
- K\_USHORT [usTop](#)  
*Uppermost pixel of the text.*
- COLOR [uColor](#)  
*Color of the text.*
- [Font\\_t](#) \* [pstFont](#)  
*Pointer to the font used to render the text.*
- const K\_CHAR \* [pcString](#)  
*ASCII String to render.*

### 16.23.1 Detailed Description

Defines a bitmap-rendered string.

Definition at line 144 of file [draw.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/draw.h](#)

## 16.24 DrawVector\_t Struct Reference

Specifies a single 2D point.

```
#include <draw.h>
```

### Public Attributes

- K\_USHORT [usX](#)
- K\_USHORT [usY](#)

### 16.24.1 Detailed Description

Specifies a single 2D point.

When used in arrays, this provides a way to draw vector paths, which form the basis of the polygon data structures.

Definition at line 204 of file [draw.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/draw.h](#)

## 16.25 DrawWindow\_t Struct Reference

Defines the active window - establishes boundaries for drawing on the current display.

```
#include <draw.h>
```

### Public Attributes

- K\_USHORT [usLeft](#)  
*Left boundary.*
- K\_USHORT [usRight](#)  
*Right boundary.*
- K\_USHORT [usTop](#)  
*Upper boundary.*
- K\_USHORT [usBottom](#)  
*Bottom boundary.*

### 16.25.1 Detailed Description

Defines the active window - establishes boundaries for drawing on the current display.

Only pixels drawn inside the surface boundaries are rendered to the output

Definition at line 175 of file [draw.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/draw.h](#)

### 16.26 Driver Class Reference

Base device-driver class used in hardware abstraction.

```
#include <driver.h>
```

Inheritance diagram for Driver:

#### Public Member Functions

- virtual void [Init](#) ()=0  
*Initialize a driver, must be called prior to use.*
- virtual K\_UCHAR [Open](#) ()=0  
*Open a device driver prior to use.*
- virtual K\_UCHAR [Close](#) ()=0  
*Close a previously-opened device driver.*
- virtual K\_USHORT [Read](#) (K\_USHORT usBytes\_, K\_UCHAR \*pucData\_)=0  
*Read a specified number of bytes from the device into a specific buffer.*
- virtual K\_USHORT [Write](#) (K\_USHORT usBytes\_, K\_UCHAR \*pucData\_)=0  
*Write a payload of data of a given length to the device.*
- virtual K\_USHORT [Control](#) (K\_USHORT usEvent\_, void \*pvDataIn\_, K\_USHORT usSizeIn\_, void \*pvDataOut\_, K\_USHORT usSizeOut\_)=0  
*This is the main entry-point for device-specific io and control operations.*
- void [SetName](#) (const K\_CHAR \*pcName\_)  
*Set the path for the driver.*
- const K\_CHAR \* [GetPath](#) ()  
*Returns a string containing the device path.*

#### Private Attributes

- const K\_CHAR \* [m\\_pcPath](#)  
*string pointer that holds the driver path (name)*

## Additional Inherited Members

### 16.26.1 Detailed Description

Base device-driver class used in hardware abstraction.

All other device drivers inherit from this class

Definition at line 121 of file [driver.h](#).

### 16.26.2 Member Function Documentation

#### 16.26.2.1 K\_UCHAR Driver::Close ( ) [pure virtual]

Close a previously-opened device driver.

##### Returns

Driver-specific return code, 0 = OK, non-0 = error

Implemented in [DevNull](#).

#### 16.26.2.2 K\_USHORT Driver::Control ( K\_USHORT *usEvent\_*, void \* *pvDataIn\_*, K\_USHORT *usSizeIn\_*, void \* *pvDataOut\_*, K\_USHORT *usSizeOut\_* ) [pure virtual]

This is the main entry-point for device-specific io and control operations.

This is used for implementing all "side-channel" communications with a device, and any device-specific IO operations that do not conform to the typical POSIX read/write paradigm. Use of this function is analagous to the non-POSIX (yet still common) `devctl()` or `ioctl()`.

##### Parameters

<i>usEvent_</i>	Code defining the io event (driver-specific)
<i>pvDataIn_</i>	Pointer to the input data
<i>usSizeIn_</i>	Size of the input data (in bytes)
<i>pvDataOut_</i>	Pointer to the output data
<i>usSizeOut_</i>	Size of the output data (in bytes)

##### Returns

Driver-specific return code, 0 = OK, non-0 = error

Implemented in [DevNull](#).

#### 16.26.2.3 const K\_CHAR \* Driver::GetPath ( ) [inline]

Returns a string containing the device path.

##### Returns

*pcName\_* Return the string constant representing the device path

Definition at line 231 of file [driver.h](#).

**16.26.2.4 K\_UCHAR Driver::Open ( )** [pure virtual]

Open a device driver prior to use.

**Returns**

Driver-specific return code, 0 = OK, non-0 = error

Implemented in [DevNull](#).

**16.26.2.5 K\_USHORT Driver::Read ( K\_USHORT *usBytes\_*, K\_UCHAR \* *pucData\_* )** [pure virtual]

Read a specified number of bytes from the device into a specific buffer.

Depending on the driver-specific implementation, this may be a number less than the requested number of bytes read, indicating that there was less input than desired, or that as a result of buffering, the data may not be available.

**Parameters**

<i>usBytes_</i>	Number of bytes to read (<= size of the buffer)
<i>pucData_</i>	Pointer to a data buffer receiving the read data

**Returns**

Number of bytes actually read

Implemented in [DevNull](#).

**16.26.2.6 void Driver::SetName ( const K\_CHAR \* *pcName\_* )** [inline]

Set the path for the driver.

Name must be set prior to access (since driver access is name-based).

**Parameters**

<i>pcName_</i>	String constant containing the device path
----------------	--

Definition at line 222 of file [driver.h](#).

**16.26.2.7 K\_USHORT Driver::Write ( K\_USHORT *usBytes\_*, K\_UCHAR \* *pucData\_* )** [pure virtual]

Write a payload of data of a given length to the device.

Depending on the implementation of the driver, the amount of data written to the device may be less than the requested number of bytes. A result less than the requested size may indicate that the device buffer is full, indicating that the user must retry the write at a later point with the remaining data.

**Parameters**

<i>usBytes_</i>	Number of bytes to write (<= size of the buffer)
<i>pucData_</i>	Pointer to a data buffer containing the data to write

**Returns**

Number of bytes actually written

Implemented in [DevNull](#).

The documentation for this class was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/driver.h](#)

## 16.27 DriverList Class Reference

List of [Driver](#) objects used to keep track of all device drivers in the system.

```
#include <driver.h>
```

### Static Public Member Functions

- static void [Init](#) ()  
*Initialize the list of drivers.*
- static void [Add](#) ([Driver](#) \*pclDriver\_ )  
*Add a [Driver](#) object to the managed global driver-list.*
- static void [Remove](#) ([Driver](#) \*pclDriver\_ )  
*Remove a driver from the global driver list.*
- static [Driver](#) \* [FindByPath](#) (const K\_CHAR \*m\_pcPath)  
*Look-up a driver in the global driver-list based on its path.*

### Static Private Attributes

- static [DoubleLinkedList](#) m\_clDriverList  
*LinkedList object used to implementing the driver object management.*

#### 16.27.1 Detailed Description

List of [Driver](#) objects used to keep track of all device drivers in the system.

By default, the list contains a single entity, "/dev/null".

Definition at line 244 of file [driver.h](#).

#### 16.27.2 Member Function Documentation

##### 16.27.2.1 DriverList::Add ( [Driver](#) \* pclDriver\_ ) [inline], [static]

Add a [Driver](#) object to the managed global driver-list.

Parameters

<a href="#">pclDriver_</a>	pointer to the driver object to add to the global driver list.
----------------------------	--

Definition at line 264 of file [driver.h](#).

##### 16.27.2.2 Driver \* DriverList::FindByPath ( const K\_CHAR \* m\_pcPath ) [static]

Look-up a driver in the global driver-list based on its path.

In the event that the driver is not found in the list, a pointer to the default "/dev/null" object is returned. In this way, unimplemented drivers are automatically stubbed out.

Definition at line 94 of file [driver.cpp](#).

##### 16.27.2.3 void DriverList::Init ( ) [static]

Initialize the list of drivers.

Must be called prior to using the device driver library.

Definition at line 85 of file [driver.cpp](#).

16.27.2.4 void DriverList::Remove ( Driver \* *pclDriver\_* ) [inline],[static]

Remove a driver from the global driver list.

Parameters

<i>pclDriver_</i>	Pointer to the driver object to remove from the global table
-------------------	--

Definition at line 274 of file [driver.h](#).

The documentation for this class was generated from the following files:

- /home/moslevin/mark3-source/embedded/stage/src/[driver.h](#)
- /home/moslevin/mark3-source/embedded/stage/src/[driver.cpp](#)

## 16.28 EventFlag Class Reference

The [EventFlag](#) class is a blocking object, similar to a semaphore or mutex, commonly used for synchronizing thread execution based on events occurring within the system.

```
#include <eventflag.h>
```

Inheritance diagram for EventFlag:

### Public Member Functions

- void [Init](#) ()  
*Init* Initializes the [EventFlag](#) object prior to use.
- K\_USHORT [Wait](#) (K\_USHORT usMask\_, EventFlagOperation\_t eMode\_)  
*Wait* - Block a thread on the specific flags in this event flag group.
- K\_USHORT [Wait](#) (K\_USHORT usMask\_, EventFlagOperation\_t eMode\_, K\_ULONG ulTimeMS\_)  
*Wait* - Block a thread on the specific flags in this event flag group.
- void [Timeout](#) ([Thread](#) \*pclOwner\_)
- void [Set](#) (K\_USHORT usMask\_)  
*Set* - Set additional flags in this object (logical OR).
- void [Clear](#) (K\_USHORT usMask\_)  
*ClearFlags* - Clear a specific set of flags within this object, specific by bitmask.
- K\_USHORT [GetMask](#) ()  
*GetMask* Returns the state of the 16-bit bitmask within this object.

### Private Member Functions

- K\_BOOL [ProcessQueue](#) ()  
*ProcessQueue*.
- void [WaitTransaction](#) ([Transaction](#) \*pclTRX\_, K\_BOOL \*pbReschedule\_)  
*WaitTransaction*.

- void [SetTransaction](#) ([Transaction](#) \*pciTRX\_, K\_BOOL \*pbReschedule\_)  
*SetTransaction.*
- void [ClearTransaction](#) ([Transaction](#) \*pciTRX\_, K\_BOOL \*pbReschedule\_)  
*ClearTransaction.*
- void [TimeoutTransaction](#) ([Transaction](#) \*pciTRX\_, K\_BOOL \*pbReschedule\_)  
*TimeoutTransaction.*

### Private Attributes

- K\_USHORT [m\\_usSetMask](#)  
*Currently set bits in the event mask.*

### Additional Inherited Members

#### 16.28.1 Detailed Description

The [EventFlag](#) class is a blocking object, similar to a semaphore or mutex, commonly used for synchronizing thread execution based on events occurring within the system.

Each [EventFlag](#) object contains a 16-bit bitmask, which is used to trigger events on associated threads. Threads wishing to block, waiting for a specific event to occur can wait on any pattern within this 16-bit bitmask to be set. Here, we provide the ability for a thread to block, waiting for ANY bits in a specified mask to be set, or for ALL bits within a specific mask to be set. Depending on how the object is configured, the bits that triggered the wakeup can be automatically cleared once a match has occurred.

Definition at line 47 of file [eventflag.h](#).

#### 16.28.2 Member Function Documentation

##### 16.28.2.1 void EventFlag::Clear ( K\_USHORT usMask\_ )

ClearFlags - Clear a specific set of flags within this object, specific by bitmask.

Parameters

<a href="#">usMask_</a>	- Bitmask of flags to clear
-------------------------	-----------------------------

Definition at line 368 of file [eventflag.cpp](#).

##### 16.28.2.2 void EventFlag::ClearTransaction ( Transaction \* pciTRX\_, K\_BOOL \* pbReschedule\_ ) [private]

ClearTransaction.

Clear event flags synchronously, as specified from an object on the transaction queue.

Parameters

<a href="#">pciTRX_</a>	- Pointer to the transaction object
<a href="#">pbReschedule_</a>	- Pointer to boolean to be set true if rescheduling is required.

Definition at line 326 of file [eventflag.cpp](#).

##### 16.28.2.3 K\_USHORT EventFlag::GetMask ( )

GetMask Returns the state of the 16-bit bitmask within this object.

**Returns**

The state of the 16-bit bitmask

Definition at line 386 of file [eventflag.cpp](#).

**16.28.2.4 K\_BOOL EventFlag::ProcessQueue ( ) [private]**

ProcessQueue.

Process the kernel transaction queue associated with this event-flag object. This executes all queued accesses in first-in first-out order, ensuring that state is preserved and results are deterministic. When this function returns, the event flag object is no longer blocked.

**Returns**

true - the sheduler must be re-run when enabled. false - the scheduler does not need to be re-run.

Definition at line 124 of file [eventflag.cpp](#).

**16.28.2.5 void EventFlag::Set ( K\_USHORT usMask\_ )**

Set - Set additional flags in this object (logical OR).

This API can potentially result in threads blocked on [Wait\(\)](#) to be unblocked.

**Parameters**

<i>usMask_</i>	- Bitmask of flags to set.
----------------	----------------------------

Definition at line 350 of file [eventflag.cpp](#).

**16.28.2.6 void EventFlag::SetTransaction ( Transaction \* pcITRX\_, K\_BOOL \* pbReschedule\_ ) [private]**

SetTransaction.

Set an event-flag mask in a synchronous operation, as specified from an object on the transaction queue.

**Parameters**

<i>pcITRX_</i>	- Pointer to the transaction object
<i>pbReschedule_</i>	- Pointer to boolean to be set true if rescheduling is required.

Definition at line 219 of file [eventflag.cpp](#).

**16.28.2.7 void EventFlag::TimeoutTransaction ( Transaction \* pcITRX\_, K\_BOOL \* pbReschedule\_ ) [private]**

TimeoutTransaction.

Perform an event flag "timeout" operation, as specified from an object on the transaction queue.

**Parameters**

<i>pcITRX_</i>	- Pointer to the transaction object
<i>pbReschedule_</i>	- Pointer to boolean to be set true if rescheduling is required.

Definition at line 333 of file [eventflag.cpp](#).

**16.28.2.8 K\_USHORT EventFlag::Wait ( K\_USHORT usMask\_, EventFlagOperation\_t eMode\_ )**

Wait - Block a thread on the specific flags in this event flag group.

## Parameters

<i>usMask_</i>	- 16-bit bitmask to block on
<i>eMode_</i>	- EVENT_FLAG_ANY: <a href="#">Thread</a> will block on any of the bits in the mask • EVENT_FLAG_ALL: <a href="#">Thread</a> will block on all of the bits in the mask

## Returns

Bitmask condition that caused the thread to unblock, or 0 on error or timeout

Definition at line 73 of file [eventflag.cpp](#).

16.28.2.9 K\_USHORT EventFlag::Wait ( K\_USHORT *usMask\_*, EventFlagOperation\_t *eMode\_*, K\_ULONG *ulTimeMS\_* )

Wait - Block a thread on the specific flags in this event flag group.

## Parameters

<i>usMask_</i>	- 16-bit bitmask to block on
<i>eMode_</i>	- EVENT_FLAG_ANY: <a href="#">Thread</a> will block on any of the bits in the mask • EVENT_FLAG_ALL: <a href="#">Thread</a> will block on all of the bits in the mask
<i>ulTimeMS_</i>	- Time to block (in ms)

## Returns

Bitmask condition that caused the thread to unblock, or 0 on error or timeout

! If the Yield operation causes a new thread to be chosen, there will ! Be a context switch at the above SetScheduler() call. The original calling ! thread will not return back until a matching SetFlags call is made.

Definition at line 77 of file [eventflag.cpp](#).

16.28.2.10 void EventFlag::WaitTransaction ( Transaction \* *pc/TRX\_*, K\_BOOL \* *pbReschedule\_* ) [private]

WaitTransaction.

Perform a synchronous even-flag blocking operation, as specified from an object on the transaction queue.

## Parameters

<i>pc/TRX_</i>	- Pointer to the transaction object
<i>pbReschedule_</i>	- Pointer to boolean to be set true if rescheduling is required.

Definition at line 160 of file [eventflag.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/eventflag.cpp](#)

## 16.29 FixedHeap Class Reference

Fixed-size-block heap allocator with multiple block sizes.

```
#include <fixed_heap.h>
```

## Public Member Functions

- void [Create](#) (void \*pvHeap\_, [HeapConfig](#) \*pclHeapConfig\_)  
*Creates a heap in a provided blob of memory with lists of fixed-size blocks configured based on the associated configuration data.*
- void \* [Alloc](#) (K\_USHORT usSize\_)  
*Allocate a blob of memory from the heap.*

## Static Public Member Functions

- static void [Free](#) (void \*pvNode\_)  
*Free a previously-allocated block of memory to the heap it was originally allocated from.*

## Private Attributes

- [HeapConfig](#) \* [m\\_paclHeaps](#)  
*Pointer to the configuration data used by the heap.*

### 16.29.1 Detailed Description

Fixed-size-block heap allocator with multiple block sizes.

Definition at line 104 of file [fixed\\_heap.h](#).

### 16.29.2 Member Function Documentation

#### 16.29.2.1 void \* FixedHeap::Alloc ( K\_USHORT usSize\_ )

Allocate a blob of memory from the heap.

If no appropriately-sized data block is available, will return NULL. Note, this API is thread- safe, and interrupt safe.

##### Parameters

<i>usSize_</i>	Size (in bytes) to allocate from the heap
----------------	---

##### Returns

Pointer to a block of data allocated, or 0 on error.

Definition at line 130 of file [fixed\\_heap.cpp](#).

#### 16.29.2.2 void FixedHeap::Create ( void \* pvHeap\_, [HeapConfig](#) \* [pclHeapConfig\\_](#) )

Creates a heap in a provided blob of memory with lists of fixed-size blocks configured based on the associated configuration data.

A heap must be created before it can be allocated/freed.

##### Parameters

<i>pvHeap_</i>	Pointer to the data blob that will contain the heap
----------------	---

<i>pclHeapConfig_</i>	Pointer to the array of config objects that define how the heap is laid out in memory, and how many blocks of what size are included. The objects in the array must be initialized, starting from smallest block-size to largest, with the final entry in the table have a 0-block size, indicating end-of-configuration.
-----------------------	---

Definition at line 113 of file [fixed\\_heap.cpp](#).

#### 16.29.2.3 void FixedHeap::Free ( void \* *pvNode\_* ) [static]

Free a previously-allocated block of memory to the heap it was originally allocated from.

This must point to the block of memory at its originally-returned pointer, and not an address within an allocated blob (as supported by some allocators).

##### Parameters

<i>pvNode_</i>	Pointer to the previously-allocated block of memory
----------------	---

Definition at line 160 of file [fixed\\_heap.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/fixed\\_heap.h](#)

## 16.31 GamePanelControl Class Reference

Inheritance diagram for GamePanelControl:

## Public Member Functions

- virtual void [Init](#) ()  
*Initialiize the control - must be called before use.*
- virtual void [Draw](#) ()  
*Redraw the control "cleanly".*
- virtual [GuiReturn\\_t](#) [ProcessEvent](#) ([GuiEvent\\_t](#) \*pstEvent\_)  
*Process an event sent to the control.*
- virtual void [Activate](#) (bool bActivate\_)  
*Activate or deactivate the current control - used when switching from one active control to another.*

## Private Attributes

- [JoystickEvent\\_t](#) [m\\_stLastJoy](#)
- [JoystickEvent\\_t](#) [m\\_stCurrentJoy](#)

## Additional Inherited Members

### 16.31.1 Detailed Description

Definition at line 32 of file [control\\_gamepanel.h](#).

### 16.31.2 Member Function Documentation

16.31.2.1 virtual void [GamePanelControl::Activate](#) ( bool *bActivate\_* ) [inline],[virtual]

Activate or deactivate the current control - used when switching from one active control to another.

Parameters

<i>bActivate_</i>	- true to activate, false to deactivate
-------------------	---

Implements [GuiControl](#).

Definition at line 38 of file [control\\_gamepanel.h](#).

16.31.2.2 void [GamePanelControl::Draw](#) ( ) [virtual]

Redraw the control "cleanly".

Subclass specific.

Implements [GuiControl](#).

Definition at line 27 of file [control\\_gamepanel.cpp](#).

16.31.2.3 virtual void [GamePanelControl::Init](#) ( ) [inline],[virtual]

Initialiize the control - must be called before use.

Implementation is subclass specific.

Implements [GuiControl](#).

Definition at line 35 of file [control\\_gamepanel.h](#).

16.31.2.4 `GuiReturn_t GamePanelControl::ProcessEvent ( GuiEvent_t * pstEvent_ ) [virtual]`

Process an event sent to the control.

Subclass specific implementation.

Parameters

<code>pstEvent_</code>	Pointer to a struct containing the event data
------------------------	---

Implements [GuiControl](#).

Definition at line 33 of file [control\\_gamepanel.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/control\\_gamepanel.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/control\\_gamepanel.cpp](#)

## 16.32 GlobalMessagePool Class Reference

Implements a list of message objects shared between all threads.

```
#include <message.h>
```

### Static Public Member Functions

- static void [Init](#) ()  
*Initialize the message queue prior to use.*
- static void [Push](#) ([Message](#) \*pclMessage\_)  
*Return a previously-claimed message object back to the global queue.*
- static [Message](#) \* [Pop](#) ()  
*Pop a message from the global queue, returning it to the user to be populated before sending by a transmitter.*

### Static Private Attributes

- static [Message](#) [m\\_aclMessagePool](#) [[GLOBAL\\_MESSAGE\\_POOL\\_SIZE](#)]  
*Array of message objects that make up the message pool.*
- static [DoubleLinkedList](#) [m\\_clList](#)  
*Linked list used to manage the [Message](#) objects.*

### 16.32.1 Detailed Description

Implements a list of message objects shared between all threads.

Definition at line 157 of file [message.h](#).

### 16.32.2 Member Function Documentation

16.32.2.1 `Message * GlobalMessagePool::Pop ( ) [static]`

Pop a message from the global queue, returning it to the user to be populated before sending by a transmitter.

**Returns**

Pointer to a [Message](#) object

Definition at line 69 of file [message.cpp](#).

**16.32.2.2** void GlobalMessagePool::Push ( Message \* *pclMessage\_* ) [static]

Return a previously-claimed message object back to the global queue.

Used once the message has been processed by a receiver.

**Parameters**

<i>pclMessage_</i>	Pointer to the <a href="#">Message</a> object to return back to the global queue
--------------------	--

Definition at line 57 of file [message.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/message.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/message.cpp](#)

## 16.33 Glyph\_t Struct Reference

**Public Attributes**

- K\_UCHAR [ucWidth](#)  
*Width of this font glyph in pixels.*
- K\_UCHAR [ucHeight](#)  
*Height of this font glyph in pixels.*
- K\_UCHAR [ucVOffset](#)  
*Vertical offset of this glyph.*
- K\_UCHAR [aucData](#) [1]  
*Glyph data array.*

### 16.33.1 Detailed Description

Definition at line 26 of file [font.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/font.h](#)

## 16.34 GraphicsDriver Class Reference

Defines the base graphics driver class, which is inherited by all other graphics drivers.

```
#include <graphics.h>
```

Inheritance diagram for GraphicsDriver:

## Public Member Functions

- virtual void [DrawPixel](#) ([DrawPoint\\_t](#) \*pstPoint\_)  
*Draw a single pixel to the display.*
- virtual void [ReadPixel](#) ([DrawPoint\\_t](#) \*pstPoint\_)  
*Read a single pixel from the display.*
- virtual void [ClearScreen](#) ()  
*Clear the screen (initializes to all black pixels)*
- virtual void [Point](#) ([DrawPoint\\_t](#) \*pstPoint\_)  
*Draw a pixel to the display.*
- virtual void [Line](#) ([DrawLine\\_t](#) \*pstLine\_)  
*Draw a line to the display using Bresenham's line drawing algorithm.*
- virtual void [Rectangle](#) ([DrawRectangle\\_t](#) \*pstRectangle\_)  
*Draws a rectangle on the display.*
- virtual void [Circle](#) ([DrawCircle\\_t](#) \*pstCircle\_)  
*Draw a circle to the display.*
- virtual void [Ellipse](#) ([DrawEllipse\\_t](#) \*pstEllipse\_)  
*Draw an ellipse to the display.*
- virtual void [Bitmap](#) ([DrawBitmap\\_t](#) \*pstBitmap\_)  
*Draw an RGB image on the display.*
- virtual void [Stamp](#) ([DrawStamp\\_t](#) \*pstStamp\_)  
*Draws a stamp (a 1-bit bitmap) on the display.*
- virtual void [Move](#) ([DrawMove\\_t](#) \*pstMove\_)  
*Move a the contents from one rectangle on screen to another rectangle, specified by the values of the input structure.*
- virtual void [TriangleWire](#) ([DrawPoly\\_t](#) \*pstPoly\_)  
*Draw a wireframe triangle to the display.*
- virtual void [TriangleFill](#) ([DrawPoly\\_t](#) \*pstPoly\_)  
*Draw a filled triangle to the display.*
- virtual void **Polygon** ([DrawPoly\\_t](#) \*pstPoly\_)
- virtual void [Text](#) ([DrawText\\_t](#) \*pstText\_)  
*Draw a string of text to the display using a bitmap font.*
- void [TextFX](#) ([DrawText\\_t](#) \*pstText\_, [TextFX\\_t](#) \*pstFX\_)  
*Render a string of text to the display with effects.*
- virtual K\_USHORT **TextWidth** ([DrawText\\_t](#) \*pstText\_)
- void [SetWindow](#) ([DrawWindow\\_t](#) \*pstWindow\_)  
*Set the drawable window of the screen.*
- void [ClearWindow](#) ()  
*Clear the window - resetting the boundaries to the entire drawable area of the screen.*

## Protected Attributes

- K\_USHORT **m\_usResX**
- K\_USHORT **m\_usResY**
- K\_USHORT **m\_usLeft**
- K\_USHORT **m\_usTop**
- K\_USHORT **m\_usRight**
- K\_USHORT **m\_usBottom**
- K\_UCHAR **m\_ucBPP**

## Additional Inherited Members

### 16.34.1 Detailed Description

Defines the base graphics driver class, which is inherited by all other graphics drivers.

Per-pixel rendering functions for all raster operations is provided by default. These can be overridden with more efficient hardware-supported operations where available.

Definition at line 32 of file [graphics.h](#).

### 16.34.2 Member Function Documentation

**16.34.2.1** void GraphicsDriver::Bitmap ( DrawBitmap\_t \* *pstBitmap\_* ) [virtual]

Draw an RGB image on the display.

Parameters

<i>pstBitmap_</i>	- pointer to the bitmap object to display
-------------------	---

Definition at line 302 of file [graphics.cpp](#).

**16.34.2.2** void GraphicsDriver::Circle ( DrawCircle\_t \* *pstCircle\_* ) [virtual]

Draw a circle to the display.

Parameters

<i>pstCircle_</i>	- pointer to the circle to draw
-------------------	---------------------------------

Definition at line 178 of file [graphics.cpp](#).

**16.34.2.3** void GraphicsDriver::DrawPixel ( DrawPoint\_t \* *pstPoint\_* ) [inline],[virtual]

Draw a single pixel to the display.

Parameters

<i>pstPoint_</i>	Structure containing the pixel data (color/location) to be written.
------------------	---

Definition at line 49 of file [graphics.h](#).

**16.34.2.4** void GraphicsDriver::Ellipse ( DrawEllipse\_t \* *pstEllipse\_* ) [virtual]

Draw an ellipse to the display.

## Parameters

<i>pstEllipse_</i>	- pointer to the ellipse to draw on the display
--------------------	---

Definition at line 250 of file [graphics.cpp](#).

16.34.2.5 void GraphicsDriver::Line ( DrawLine\_t \* *pstLine\_* ) [virtual]

Draw a line to the display using Bresenham's line drawing algorithm.

## Parameters

<i>pstLine_</i>	- pointer to the line structure
-----------------	---------------------------------

Definition at line 50 of file [graphics.cpp](#).

16.34.2.6 void GraphicsDriver::Move ( DrawMove\_t \* *pstMove\_* ) [virtual]

Move a the contents from one rectangle on screen to another rectangle, specified by the values of the input structure.

## Parameters

<i>pstMove_</i>	- object describing the graphics movement operation (framebuffer operations only).
-----------------	--

Definition at line 440 of file [graphics.cpp](#).

16.34.2.7 void GraphicsDriver::Point ( DrawPoint\_t \* *pstPoint\_* ) [virtual]

Draw a pixel to the display.

## Parameters

<i>pstPoint_</i>	- pointer to the struct containing the pixel to draw
------------------	--

Definition at line 44 of file [graphics.cpp](#).

16.34.2.8 void GraphicsDriver::ReadPixel ( DrawPoint\_t \* *pstPoint\_* ) [inline],[virtual]

Read a single pixel from the display.

## Parameters

<i>pstPoint_</i>	Structure containing the pixel location of the pixel to be read. The color value will contain the value from the display when read.
------------------	---

Definition at line 58 of file [graphics.h](#).

16.34.2.9 void GraphicsDriver::Rectangle ( DrawRectangle\_t \* *pstRectangle\_* ) [virtual]

Draws a rectangle on the display.

## Parameters

<i>pstRectangle_</i>	- pointer to the rectangle struct
----------------------	-----------------------------------

Definition at line 133 of file [graphics.cpp](#).

16.34.2.10 void GraphicsDriver::SetWindow ( DrawWindow\_t \* *pstWindow\_* )

Set the drawable window of the screen.

## Parameters

<i>pstWindow_</i>	- pointer to the window struct defining the drawable area
-------------------	---

Definition at line 1050 of file [graphics.cpp](#).

16.34.2.11 void GraphicsDriver::Stamp ( DrawStamp\_t \* *pstStamp\_* ) [virtual]

Draws a stamp (a 1-bit bitmap) on the display.

## Parameters

<i>pstStamp_</i>	- pointer to the stamp object to draw
------------------	---------------------------------------

Definition at line 401 of file [graphics.cpp](#).

16.34.2.12 void GraphicsDriver::Text ( DrawText\_t \* *pstText\_* ) [virtual]

Draw a string of text to the display using a bitmap font.

## Parameters

<i>pstText_</i>	- pointer to the text object to render
-----------------	--

Definition at line 501 of file [graphics.cpp](#).

16.34.2.13 GraphicsDriver::TextFX ( DrawText\_t \* *pstText\_*, TextFX\_t \* *pstFX\_* )

Render a string of text to the display with effects.

## Parameters

<i>pstText_</i>	- pointer to the text object to render
<i>pstFX_</i>	- struct defining special text formatting to apply

ToDo - Add rotation

Definition at line 589 of file [graphics.cpp](#).

16.34.2.14 void GraphicsDriver::TriangleFill ( DrawPoly\_t \* *pstPoly\_* ) [virtual]

Draw a filled triangle to the display.

## Parameters

<i>pstPoly_</i>	Pointer to the polygon to draw.
-----------------	---------------------------------

Definition at line 823 of file [graphics.cpp](#).

16.34.2.15 void GraphicsDriver::TriangleWire ( DrawPoly\_t \* *pstPoly\_* ) [virtual]

Draw a wireframe triangle to the display.

## Parameters

<i>pstPoly_</i>	Pointer to the polygon to draw.
-----------------	---------------------------------

Definition at line 798 of file [graphics.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/graphics.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/graphics.cpp](#)

## 16.35 GroupBoxControl Class Reference

Inheritance diagram for GroupBoxControl:

### Public Member Functions

- virtual void **Init** ()  
*Initialiize the control - must be called before use.*
- virtual void **Draw** ()  
*Redraw the control "cleanly".*
- virtual **GuiReturn\_t ProcessEvent** (**GuiEvent\_t** \*pstEvent\_)  
*Process an event sent to the control.*

*Pointer to the parent window associated with this control.*

## Friends

- class **GuiWindow**
- class **GuiEventSurface**

## Additional Inherited Members

### 16.36.1 Detailed Description

GUI Control Base Class.

This class is the common ancestor to all GUI control elements. It defines a base set of properties common to all controls, as well as methods for initialization, event handling, and redrawing. Controls are directly related to Windows, which are used to manage and organize controls.

Definition at line 538 of file [gui.h](#).

### 16.36.2 Member Function Documentation

#### 16.36.2.1 void GuiControl::Activate ( bool *bActivate\_* ) [pure virtual]

Activate or deactivate the current control - used when switching from one active control to another.

Parameters

<i>bActivate_</i>	- true to activate, false to deactivate
-------------------	---

Implemented in [StubControl](#), [NotificationControl](#), [LabelControl](#), [ButtonControl](#), [PanelControl](#), [SlickButtonControl](#), [GamePanelControl](#), [GroupBoxControl](#), [ProgressControl](#), [SlickProgressControl](#), [CheckBoxControl](#), and [SlickGroupBoxControl](#).

#### 16.36.2.2 void GuiControl::ClearStale ( ) [inline],[protected]

Clear the stale flag for this control.

Should only be done after a redraw has been completed

Definition at line 741 of file [gui.h](#).

#### 16.36.2.3 void GuiControl::Draw ( ) [pure virtual]

Redraw the control "cleanly".

Subclass specific.

Implemented in [StubControl](#), [NotificationControl](#), [LabelControl](#), [ButtonControl](#), [PanelControl](#), [SlickButtonControl](#), [GamePanelControl](#), [GroupBoxControl](#), [ProgressControl](#), [SlickProgressControl](#), [CheckBoxControl](#), and [SlickGroupBoxControl](#).

**16.36.2.4 K\_UCHAR GuiControl::GetControlIndex ( ) [inline]**

Return the Control Index of the control.

**Returns**

The control index of the control

Definition at line 648 of file [gui.h](#).

**16.36.2.5 void GuiControl::GetControlOffset ( K\_USHORT \* *pusX\_*, K\_USHORT \* *pusY\_* )**

Return the absolute offset of the control within an event surface.

This function will traverse through all of the object's parents, and their parents, until the root control and root window are identified. The absolute pixel locations of the Topmost (Y) and Leftmost (X) pixels are populated in the

**Parameters**

<i>pusX_</i>	Pointer to the K_USHORT containing the leftmost pixel
<i>pusY_</i>	Pointer to the K_USHORT containing the topmost pixel

Definition at line 669 of file [gui.cpp](#).

**16.36.2.6 K\_USHORT GuiControl::GetHeight ( ) [inline]**

Get the height of the control in pixels.

**Returns**

Height of the control in pixels

Definition at line 627 of file [gui.h](#).

**16.36.2.7 K\_USHORT GuiControl::GetLeft ( ) [inline]**

Return the leftmost pixel of the control.

**Returns**

Leftmost pixel of the control

Definition at line 620 of file [gui.h](#).

**16.36.2.8 GuiControl \* GuiControl::GetParentControl ( ) [inline], [protected]**

Return the pointer to the control's currently-assigned parent control.

**Returns**

Pointer to the Control's currently assigned parent control.

Definition at line 725 of file [gui.h](#).

**16.36.2.9** `GuiWindow * GuiControl::GetParentWindow ( ) [inline], [protected]`

Get the parent window of this control.

**Returns**

Pointer to the control's window

Definition at line 733 of file [gui.h](#).

**16.36.2.10** `K_USHORT GuiControl::GetTop ( ) [inline]`

Return the topmost pixel of the control.

**Returns**

Topmost pixel of the control

Definition at line 613 of file [gui.h](#).

**16.36.2.11** `K_USHORT GuiControl::GetWidth ( ) [inline]`

Get the width of the control in pixels.

**Returns**

Width of the control in pixels

Definition at line 634 of file [gui.h](#).

**16.36.2.12** `K_UCHAR GuiControl::GetZOrder ( ) [inline]`

Return the Z-order of the control.

**Returns**

Z-order of the control

Definition at line 641 of file [gui.h](#).

**16.36.2.13** `void GuiControl::Init ( ) [pure virtual]`

Initialiize the control - must be called before use.

Implementation is subclass specific.

Implemented in [StubControl](#), [ButtonControl](#), [PanelControl](#), [SlickButtonControl](#), [GamePanelControl](#), [LabelControl](#), [ProgressControl](#), [SlickProgressControl](#), [CheckBoxControl](#), [GroupBoxControl](#), [NotificationControl](#), and [SlickGroupBoxControl](#).

**16.36.2.14** `K_BOOL GuiControl::IsInFocus ( ) [inline]`

Return whether or not the current control has the focus in the window.

**Returns**

true if this control is in focus, false otherwise

Definition at line 677 of file [gui.h](#).

16.36.2.15 `K_BOOL GuiControl::IsStale ( ) [inline]`

Return whether or not the control needs to be redrawn or not.

#### Returns

true - control needs redrawing, false - control is intact.

Definition at line 655 of file [gui.h](#).

16.36.2.16 `GuiReturn_t GuiControl::ProcessEvent ( GuiEvent_t * pstEvent_ ) [pure virtual]`

Process an event sent to the control.

Subclass specific implementation.

#### Parameters

<i>pstEvent_</i>	Pointer to a struct containing the event data
------------------	---

Implemented in [StubControl](#), [NotificationControl](#), [LabelControl](#), [ButtonControl](#), [PanelControl](#), [SlickButtonControl](#), [GamePanelControl](#), [GroupBoxControl](#), [ProgressControl](#), [SlickProgressControl](#), [CheckBoxControl](#), and [SlickGroupBoxControl](#).

16.36.2.17 `void GuiControl::SetControllIndex ( K_UCHAR ucIdx_ ) [inline]`

Set the index of the control, used for cycling through focus (ala tab order in VB).

#### Parameters

<i>ucIdx_</i>	Focus index of the control
---------------	----------------------------

Definition at line 606 of file [gui.h](#).

16.36.2.18 `void GuiControl::SetHeight ( K_USHORT usHeight_ ) [inline]`

Set the height of the control (in pixels)

#### Parameters

<i>usHeight_</i>	Height of the control in pixels
------------------	---------------------------------

Definition at line 584 of file [gui.h](#).

16.36.2.19 `void GuiControl::SetLeft ( K_USHORT usLeft_ ) [inline]`

Set the location of the leftmost pixel of the control.

#### Parameters

<i>usLeft_</i>	Leftmost pixel of the control
----------------	-------------------------------

Definition at line 577 of file [gui.h](#).

16.36.2.20 `void GuiControl::SetParentControl ( GuiControl * pclParent_ ) [inline], [protected]`

Set the parent control of this control.

When a control has its parent set, it is considered "nested" within that control. Moving the control will thus result in all of its child controls to become invalidated, thus requiring redraws. The control's object offsets (Top, Bottom, Height, and Width) also become relative to the origin of the parent control.

## Parameters

<i>pciParent_</i>	Pointer to the control's parent control
-------------------	---

Definition at line 706 of file [gui.h](#).

**16.36.2.21** void GuiControl::SetParentWindow ( GuiWindow \* *pciWindow\_* ) [inline], [protected]

Set the parent window of this control.

All controls within the same window are all associated together, and share events targetted towards a specific window. Event tabbing, focus, and Z-ordering is also shared between controls within a window.

## Parameters

<i>pciWindow_</i>	Pointer to the control's parent window.
-------------------	---

Definition at line 717 of file [gui.h](#).

**16.36.2.22** void GuiControl::SetTop ( K\_USHORT *usTop\_* ) [inline]

Set the location of the topmost pixel of the control.

## Parameters

<i>usTop_</i>	Topmost pixel of the control
---------------	------------------------------

Definition at line 570 of file [gui.h](#).

**16.36.2.23** void GuiControl::SetWidth ( K\_USHORT *usWidth\_* ) [inline]

Set the width of the control (in pixels)

## Parameters

<i>usWidth_</i>	Width of the control in pixels
-----------------	--------------------------------

Definition at line 591 of file [gui.h](#).

**16.36.2.24** void GuiControl::SetZOrder ( K\_UCHAR *ucZ\_* ) [inline]

Set the Z-order (depth) of the control.

## Parameters

<i>ucZ_</i>	Z order of the control
-------------	------------------------

Definition at line 598 of file [gui.h](#).

### 16.36.3 Member Data Documentation

**16.36.3.1** K\_UCHAR GuiControl::m\_ucControlIndex [private]

Index of the control in the window.

This is used for setting focus when transitioning from control to control on a window

Definition at line 770 of file [gui.h](#).

### 16.36.3.2 K\_UCHAR GuiControl::m\_ucZOrder [private]

The Z-Order (depth) of the control.

Only the highest order controls are visible at any given location

Definition at line 766 of file [gui.h](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/gui.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/gui.cpp](#)

## 16.37 GuiEvent\_t Struct Reference

Composite UI event structure.

```
#include <gui.h>
```

### Public Attributes

- K\_UCHAR [ucEventType](#)  
*GuiEventType\_t event type.*
- K\_UCHAR [ucTargetID](#)  
*Control index that this event is targeted towards.*

### 16.37.1 Detailed Description

Composite UI event structure.

Depending on the event type, can contain either a keyboard, mouse, touch, joystick, timer event, etc.

Definition at line 187 of file [gui.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/gui.h](#)

## 16.38 GuiEventSurface Class Reference

GUI Event Surface Object.

```
#include <gui.h>
```

### Public Member Functions

- void [Init](#) ()  
*Initialize an event surface before use.*
- void [AddWindow](#) ([GuiWindow](#) \*pclWindow\_)  
*Add a window to the event surface.*
- void [RemoveWindow](#) ([GuiWindow](#) \*pclWindow\_)  
*Remove a window from the event surface.*

- K\_BOOL [SendEvent](#) ([GuiEvent\\_t](#) \*pstEvent\_)  
*Send an event to this window surface.*
- K\_BOOL [ProcessEvent](#) ()  
*Process an event in the event queue.*
- K\_UCHAR [GetEventCount](#) ()  
*Get the count of pending events in the event surface's queue.*
- [GuiWindow](#) \* [FindWindowByName](#) (const K\_CHAR \*szName\_)  
*Return a pointer to a window by name, or NULL on failure.*
- void [InvalidateRegion](#) (K\_USHORT usLeft\_, K\_USHORT usTop\_, K\_USHORT usWidth\_, K\_USHORT usHeight\_)  
*Invalidate a region of the window, specified by the bounding box.*

### Private Member Functions

- void [CopyEvent](#) ([GuiEvent\\_t](#) \*pstDst\_, [GuiEvent\\_t](#) \*pstSrc\_)  
*Copy the contents of one message structure to another.*

### Private Attributes

- [DoubleLinkedList](#) [m\\_clWindowList](#)  
*List of windows managed on this event surface.*
- [MessageQueue](#) [m\\_clMessageQueue](#)  
*Message queue used to manage window events.*

## 16.38.1 Detailed Description

GUI Event Surface Object.

An event surface is the lowest-level UI object. It maintains a list of windows which are associated with it, and manages the transmission and routing of events to each window, and their appropriate controls

All windows located on the event surface are assumed to share a common display, and coordinate frame. In this way, multiple GUIs can be implemented in the system, each tied to separate physical or virtual displays.

Definition at line 452 of file [gui.h](#).

## 16.38.2 Member Function Documentation

### 16.38.2.1 void GuiEventSurface::AddWindow ( [GuiWindow](#) \* *pciWindow\_* )

Add a window to the event surface.

Parameters

<i>pciWindow_</i>	Pointer to the window object to add to the surface
-------------------	--

Definition at line 525 of file [gui.cpp](#).

### 16.38.2.2 void GuiEventSurface::CopyEvent ( [GuiEvent\\_t](#) \* *pstDst\_*, [GuiEvent\\_t](#) \* *pstSrc\_* ) [private]

Copy the contents of one message structure to another.

## Parameters

<i>pstDst_</i>	Destination event pointer
<i>pstSrc_</i>	Source event pointer

Definition at line 645 of file [gui.cpp](#).

### 16.38.2.3 void GuiEventSurface::Init ( ) [inline]

Initialize an event surface before use.

Must be called prior to any other object methods.

Definition at line 459 of file [gui.h](#).

### 16.38.2.4 void GuiEventSurface::InvalidateRegion ( K\_USHORT usLeft\_, K\_USHORT usTop\_, K\_USHORT usWidth\_, K\_USHORT usHeight\_ )

Invalidate a region of the window, specified by the bounding box.

The coordinates specified in the parameters (top and left) refer to absolute display coordinates, and are not relative to coordinates within a window.

Definition at line 658 of file [gui.cpp](#).

### 16.38.2.5 K\_BOOL GuiEventSurface::ProcessEvent ( )

Process an event in the event queue.

If no events are pending, the call will block until an event is available.

Definition at line 577 of file [gui.cpp](#).

### 16.38.2.6 void GuiEventSurface::RemoveWindow ( GuiWindow \* pclWindow\_ )

Remove a window from the event surface.

## Parameters

<i>pclWindow_</i>	Pointer to the window object to remove from the surface
-------------------	---

Definition at line 533 of file [gui.cpp](#).

### 16.38.2.7 K\_BOOL GuiEventSurface::SendEvent ( GuiEvent\_t \* pstEvent\_ )

Send an event to this window surface.

The event will be forwarded to all windows managed by this service.

## Parameters

<i>pstEvent_</i>	Pointer to an event to send
------------------	-----------------------------

## Returns

true on success, false on failure

Definition at line 541 of file [gui.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/gui.h](#)

- </home/moslevin/mark3-source/embedded/stage/src/gui.cpp>

## 16.39 GuiWindow Class Reference

Basic Window Class.

```
#include <gui.h>
```

Inheritance diagram for GuiWindow:

### Public Member Functions

- void [Init](#) ()  
*Initialize the GUI Window object prior to use.*
- void [SetDriver](#) ([GraphicsDriver](#) \*pclDriver\_)  
*Set the graphics driver to use for rendering controls on the window.*
- [GraphicsDriver](#) \* [GetDriver](#) ()  
*Set the graphics driver to use for rendering controls on the window.*
- void [AddControl](#) ([GuiControl](#) \*pclControl\_, [GuiControl](#) \*pclParent\_)  
*Assign a GUI Control to this window object.*
- void [RemoveControl](#) ([GuiControl](#) \*pclControl\_)  
*Removes a previously-added control from the Window.*
- K\_UCHAR [GetMaxZOrder](#) ()  
*Returns the highest Z-Order of all controls attached to this window.*
- void [Redraw](#) (K\_BOOL bRedrawAll\_)  
*Redraw objects in the window.*
- void [ProcessEvent](#) ([GuiEvent\\_t](#) \*pstEvent\_)  
*Process an event sent to this window.*
- void [SetFocus](#) ([GuiControl](#) \*pclControl\_)  
*Set the control used to accept "focus" events.*
- K\_BOOL [IsInFocus](#) ([GuiControl](#) \*pclControl\_)  
*Return whether or not the selected control is in focus or not.*
- void [SetTop](#) (K\_USHORT usTop\_)  
*Set the location of the topmost pixel of the window.*
- void [SetLeft](#) (K\_USHORT usLeft\_)  
*Set the location of the leftmost pixel of the window.*
- void [SetHeight](#) (K\_USHORT usHeight\_)  
*Set the height of the window (in pixels)*
- void [SetWidth](#) (K\_USHORT usWidth\_)  
*Set the width of the window (in pixels)*
- K\_USHORT [GetTop](#) ()  
*Return the topmost pixel of the window.*
- K\_USHORT [GetLeft](#) ()  
*Return the leftmost pixel of the window.*
- K\_USHORT [GetHeight](#) ()

- Get the height of the window in pixels.*

  - K\_USHORT [GetWidth](#) ()

*Get the width of the window in pixels.*
- K\_UCHAR [GetZOrder](#) ()

*Get the Z-order of the window on the event surface.*
- void [SetZOrder](#) (K\_UCHAR ucZ\_)

*Set the Z-order of the window on the event surface.*
- void [CycleFocus](#) (bool bForward\_)

*Cycle the focus to the next active control in the window.*
- void [SetName](#) (const K\_CHAR \*szName\_)

*Set the name for this window.*
- const K\_CHAR \* [GetName](#) ()

*Return the name of this window.*
- void [InvalidateRegion](#) (K\_USHORT usLeft\_, K\_USHORT usTop\_, K\_USHORT usWidth\_, K\_USHORT usHeight\_)

*Invalidate a region of the window, specified by the bounding box.*

## Private Attributes

- K\_USHORT [m\\_usTop](#)

*Topmost pixel of the window on the event surface.*
- K\_USHORT [m\\_usLeft](#)

*Leftmost pixel of the window on the event surface.*
- K\_USHORT [m\\_usHeight](#)

*Height of the window in pixels.*
- K\_USHORT [m\\_usWidth](#)

*Width of the window in pixels.*
- K\_UCHAR [m\\_ucZ](#)

*Z-order of the window on the event surface.*
- const K\_CHAR \* [m\\_szName](#)

*Name applied to this window.*
- [DoubleLinkedList](#) [m\\_clControlList](#)

*List of controls managed by this window.*
- [GuiControl](#) \* [m\\_pclInFocus](#)

*Pointer to the control in event focus.*
- K\_UCHAR [m\\_ucControlCount](#)

*Number of controls in this window.*
- [GraphicsDriver](#) \* [m\\_pclDriver](#)

*Graphics driver for this window.*

## Additional Inherited Members

### 16.39.1 Detailed Description

Basic Window Class.

A Window is loosely defined as a container of controls, all sharing a coordinate reference coordinate frame. Events are managed on a per-window basis, and each window is isolated from eachother.

Definition at line 223 of file [gui.h](#).

## 16.39.2 Member Function Documentation

### 16.39.2.1 GuiWindow::AddControl ( **GuiControl** \* *pclControl\_*, **GuiControl** \* *pclParent\_* )

Assign a GUI Control to this window object.

Adding an object to a window ensures that the object will be drawn on the specific window surface, and ensures that events directed to this window will be forwarded to the controls appropriately.

#### Parameters

<i>pclControl_</i>	Pointer to the control object to add
<i>pclParent_</i>	Pointer to the control's "parent" object (or NULL)

Definition at line 27 of file [gui.cpp](#).

### 16.39.2.2 void GuiWindow::CycleFocus ( **bool** *bForward\_* )

Cycle the focus to the next active control in the window.

#### Parameters

<i>bForward_</i>	- Cycle to the next control when true, previous control when false
------------------	--

Definition at line 395 of file [gui.cpp](#).

### 16.39.2.3 **GraphicsDriver** \* GuiWindow::GetDriver ( ) [inline]

Set the graphics driver to use for rendering controls on the window.

#### Returns

Pointer to the Window's graphics driver

Definition at line 252 of file [gui.h](#).

### 16.39.2.4 **K\_USHORT** GuiWindow::GetHeight ( ) [inline]

Get the height of the window in pixels.

#### Returns

Height of the window in pixels

Definition at line 379 of file [gui.h](#).

### 16.39.2.5 **K\_USHORT** GuiWindow::GetLeft ( ) [inline]

Return the leftmost pixel of the window.

#### Returns

Leftmost pixel of the window

Definition at line 372 of file [gui.h](#).

**16.39.2.6 K\_UCHAR GuiWindow::GetMaxZOrder ( )**

Returns the highest Z-Order of all controls attached to this window.

**Returns**

The highest Z-Order used by controls in this window

Definition at line 61 of file [gui.cpp](#).

**16.39.2.7 K\_USHORT GuiWindow::GetTop ( ) [inline]**

Return the topmost pixel of the window.

**Returns**

Topmost pixel of the window

Definition at line 365 of file [gui.h](#).

**16.39.2.8 K\_USHORT GuiWindow::GetWidth ( ) [inline]**

Get the width of the window in pixels.

**Returns**

Width of the window in pixels

Definition at line 386 of file [gui.h](#).

**16.39.2.9 void GuiWindow::Init ( ) [inline]**

Initialize the GUI Window object prior to use.

Must be called before calling other methods on this object

Definition at line 231 of file [gui.h](#).

**16.39.2.10 void GuiWindow::InvalidateRegion ( K\_USHORT *usLeft\_*, K\_USHORT *usTop\_*, K\_USHORT *usWidth\_*, K\_USHORT *usHeight\_* )**

Invalidate a region of the window, specified by the bounding box.

The coordinates specified in the parameters (top and left) refer to absolute display coordinates, and are not relative to coordinates within a window.

Definition at line 127 of file [gui.cpp](#).

**16.39.2.11 K\_BOOL GuiWindow::IsInFocus ( GuiControl \* *pclControl\_* ) [inline]**

Return whether or not the selected control is in focus or not.

**Parameters**

<i>pclControl_</i>	Pointer to the control object to evaluate
--------------------	---

**Returns**

true - the selected control is the active control on the window false - otherwise

Definition at line 323 of file [gui.h](#).

#### 16.39.2.12 void GuiWindow::ProcessEvent ( GuiEvent\_t \* pstEvent\_ )

Process an event sent to this window.

This method handles all of the plumbing required to target the event towards specific controls, or all controls in the window depending on the event payload.

Definition at line 245 of file [gui.cpp](#).

#### 16.39.2.13 void GuiWindow::Redraw ( K\_BOOL bRedrawAll\_ )

Redraw objects in the window.

Typically, only the affected controls will need to be redrawn, but in some cases (such as window initialization), the entire window will need to be redrawn cleanly. This behavior is defined by the value of the bRedrawAll\_ parameter.

Definition at line 85 of file [gui.cpp](#).

#### 16.39.2.14 GuiWindow::RemoveControl ( GuiControl \* pclControl\_ )

Removes a previously-added control from the Window.

**Parameters**

<i>pclControl_</i>	Pointer to the control object to remove
--------------------	---

Definition at line 40 of file [gui.cpp](#).

#### 16.39.2.15 void GuiWindow::SetDriver ( GraphicsDriver \* pclDriver\_ ) [inline]

Set the graphics driver to use for rendering controls on the window.

**Parameters**

<i>pclDriver_</i>	Pointer to the graphics driver
-------------------	--------------------------------

Definition at line 244 of file [gui.h](#).

#### 16.39.2.16 void GuiWindow::SetFocus ( GuiControl \* pclControl\_ )

Set the control used to accept "focus" events.

Such events include keyboard events.

**Parameters**

<i>pclControl_</i>	Pointer to the control object to set focus on.
--------------------	--

Definition at line 387 of file [gui.cpp](#).

16.39.2.17 void GuiWindow::SetHeight ( K\_USHORT *usHeight\_* ) [inline]

Set the height of the window (in pixels)

## Parameters

<i>usHeight_</i>	Height of the window in pixels
------------------	--------------------------------

Definition at line 351 of file [gui.h](#).

16.39.2.18 void GuiWindow::SetLeft ( K\_USHORT *usLeft\_* ) [inline]

Set the location of the leftmost pixel of the window.

## Parameters

<i>usLeft_</i>	Leftmost pixel of the window
----------------	------------------------------

Definition at line 344 of file [gui.h](#).

16.39.2.19 void GuiWindow::SetTop ( K\_USHORT *usTop\_* ) [inline]

Set the location of the topmost pixel of the window.

## Parameters

<i>usTop_</i>	Topmost pixel of the window
---------------	-----------------------------

Definition at line 337 of file [gui.h](#).

16.39.2.20 void GuiWindow::SetWidth ( K\_USHORT *usWidth\_* ) [inline]

Set the width of the window (in pixels)

## Parameters

<i>usWidth_</i>	Width of the window in pixels
-----------------	-------------------------------

Definition at line 358 of file [gui.h](#).

## 16.39.3 Member Data Documentation

16.39.3.1 GraphicsDriver\* GuiWindow::m\_pclDriver [private]

Graphics driver for this window.

Definition at line 436 of file [gui.h](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/gui.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/gui.cpp](#)

## 16.40 HeapConfig Class Reference

Heap configuration object.

```
#include <fixed_heap.h>
```

## Public Attributes

- K\_USHORT [m\\_usBlockSize](#)

- *Block size in bytes.*  
K\_USHORT [m\\_usBlockCount](#)  
*Number of blocks to create @ this size.*

### Protected Attributes

- [BlockHeap m\\_clHeap](#)  
*BlockHeap object used by the allocator.*

### Friends

- class **FixedHeap**

#### 16.40.1 Detailed Description

Heap configuration object.

Definition at line 90 of file [fixed\\_heap.h](#).

The documentation for this class was generated from the following file:

#### 16.42 Kernel Class Reference

Class that encapsulates all of the kernel startup functions.

```
#include <kernel.h>
```

### Static Public Member Functions

- static void [Init](#) (void)  
*Kernel Initialization Function, call before any other OS function.*

- static void [Start](#) (void)  
*Start the kernel; function never returns.*
- static bool [IsStarted](#) ()  
*IsStarted.*
- static void [SetPanic](#) (panic\_func\_t pfPanic\_)  
*SetPanic Set a function to be called when a kernel panic occurs, giving the user to determine the behavior when a catastrophic failure is observed.*
- static bool [IsPanic](#) ()  
*IsPanic Returns whether or not the kernel is in a panic state.*
- static void [Panic](#) (K\_USHORT usCause\_)  
*Panic Cause the kernel to enter its panic state.*

### Static Private Attributes

- static bool [m\\_bIsStarted](#)  
*true if kernel is running, false otherwise*
- static bool [m\\_bIsPanic](#)  
*true if kernel is in panic state, false otherwise*
- static panic\_func\_t [m\\_pfPanic](#)  
*user-set panic function*

#### 16.42.1 Detailed Description

Class that encapsulates all of the kernel startup functions.

Definition at line 42 of file [kernel.h](#).

#### 16.42.2 Member Function Documentation

##### 16.42.2.1 `Kernel::Init( void ) [static]`

[Kernel](#) Initialization Function, call before any other OS function.

Initializes all global resources used by the operating system. This must be called before any other kernel function is invoked.

Definition at line 48 of file [kernel.cpp](#).

##### 16.42.2.2 `static bool Kernel::IsPanic( ) [inline],[static]`

[IsPanic](#) Returns whether or not the kernel is in a panic state.

##### Returns

Whether or not the kernel is in a panic state

Definition at line 89 of file [kernel.h](#).

##### 16.42.2.3 `static bool Kernel::IsStarted( ) [inline],[static]`

[IsStarted](#).

##### Returns

Whether or not the kernel has started - true = running, false = not started

Definition at line 74 of file [kernel.h](#).

16.42.2.4 `void Kernel::Panic ( K_USHORT usCause_ ) [static]`

Panic Cause the kernel to enter its panic state.

Parameters

<i>usCause_</i>	Reason for the kernel panic
-----------------	-----------------------------

Definition at line 88 of file [kernel.cpp](#).

16.42.2.5 `static void Kernel::SetPanic ( panic_func_t pfPanic_ ) [inline],[static]`

SetPanic Set a function to be called when a kernel panic occurs, giving the user to determine the behavior when a catastrophic failure is observed.

Parameters

<i>pfPanic_</i>	Panic function pointer
-----------------	------------------------

Definition at line 83 of file [kernel.h](#).

16.42.2.6 `Kernel::Start ( void ) [static]`

Start the kernel; function never returns.

Start the operating system kernel - the current execution context is cancelled, all kernel services are started, and the processor resumes execution at the entrypoint for the highest-priority thread.

You must have at least one thread added to the kernel before calling this function, otherwise the behavior is undefined.

Definition at line 78 of file [kernel.cpp](#).

The documentation for this class was generated from the following files:

## 16.43 KernelSWI Class Reference

Class providing the software-interrupt required for context-switching in the kernel.

```
#include <kernelswi.h>
```

### Static Public Member Functions

- static void [Config](#) (void)  
*Configure the software interrupt - must be called before any other software interrupt functions are called.*
- static void [Start](#) (void)  
*Enable ("Start") the software interrupt functionality.*
- static void [Stop](#) (void)  
*Disable the software interrupt functionality.*
- static void [Clear](#) (void)  
*Clear the software interrupt.*
- static void [Trigger](#) (void)  
*Call the software interrupt.*
- static K\_UCHAR [DI](#) ()

*Disable the SWI flag itself.*

- static void [RI](#) (K\_UCHAR bEnable\_)

*Restore the state of the SWI to the value specified.*

### 16.43.1 Detailed Description

Class providing the software-interrupt required for context-switching in the kernel.

Definition at line 32 of file [kernelswi.h](#).

### 16.43.2 Member Function Documentation

#### 16.43.2.1 K\_UCHAR KernelSWI::DI ( ) [static]

Disable the SWI flag itself.

##### Returns

previous status of the SWI, prior to the DI call

Definition at line 50 of file [kernelswi.cpp](#).

#### 16.43.2.2 void KernelSWI::RI ( K\_UCHAR bEnable\_ ) [static]

Restore the state of the SWI to the value specified.

##### Parameters

<i>bEnable_</i>	true - enable the SWI, false - disable SWI
-----------------	--

Definition at line 58 of file [kernelswi.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/kernelswi.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/kernelswi.cpp](#)

## 16.44 KernelTimer Class Reference

Hardware timer interface, used by all scheduling/timer subsystems.

```
#include <kerneltimer.h>
```

### Static Public Member Functions

- static void [Config](#) (void)  
*Initializes the kernel timer before use.*
- static void [Start](#) (void)  
*Starts the kernel time (must be configured first)*
- static void [Stop](#) (void)  
*Shut down the kernel timer, used when no timers are scheduled.*
- static K\_UCHAR [DI](#) (void)  
*Disable the kernel timer's expiry interrupt.*
- static void [RI](#) (K\_UCHAR bEnable\_)

- Retstore the state of the kernel timer's expiry interrupt.*
- static void [EI](#) (void)  
*Enable the kernel timer's expiry interrupt.*
- static K\_ULONG [SubtractExpiry](#) (K\_ULONG ullInterval\_)  
*Subtract the specified number of ticks from the timer's expiry count register.*
- static K\_ULONG [TimeToExpiry](#) (void)  
*Returns the number of ticks remaining before the next timer expiry.*
- static K\_ULONG [SetExpiry](#) (K\_ULONG ullInterval\_)  
*Resets the kernel timer's expiry interval to the specified value.*
- static K\_ULONG [GetOvertime](#) (void)  
*Return the number of ticks that have elapsed since the last expiry.*
- static void [ClearExpiry](#) (void)  
*Clear the hardware timer expiry register.*

### Static Private Member Functions

- static K\_USHORT [Read](#) (void)  
*Safely read the current value in the timer register.*

#### 16.44.1 Detailed Description

Hardware timer interface, used by all scheduling/timer subsystems.

Definition at line 33 of file [kerneltimer.h](#).

#### 16.44.2 Member Function Documentation

##### 16.44.2.1 K\_ULONG KernelTimer::GetOvertime ( void ) [static]

Return the number of ticks that have elapsed since the last expiry.

##### Returns

Number of ticks that have elapsed after last timer expiration

Definition at line 115 of file [kerneltimer.cpp](#).

##### 16.44.2.2 K\_USHORT KernelTimer::Read ( void ) [static],[private]

Safely read the current value in the timer register.

##### Returns

Value held in the timer register

Definition at line 66 of file [kerneltimer.cpp](#).

##### 16.44.2.3 void KernelTimer::RI ( K\_UCHAR bEnable\_ ) [static]

Retstore the state of the kernel timer's expiry interrupt.

## Parameters

<i>bEnable_</i>	1 enable, 0 disable
-----------------	---------------------

Definition at line 168 of file [kerneltimer.cpp](#).

## 16.44.2.4 K\_ULONG KernelTimer::SetExpiry ( K\_ULONG ulInterval\_ ) [static]

Resets the kernel timer's expiry interval to the specified value.

## Parameters

<i>ulInterval_</i>	Desired interval in ticks to set the timer for
--------------------	--

## Returns

Actual number of ticks set (may be less than desired)

Definition at line 121 of file [kerneltimer.cpp](#).

## 16.44.2.5 K\_ULONG KernelTimer::SubtractExpiry ( K\_ULONG ulInterval\_ ) [static]

Subtract the specified number of ticks from the timer's expiry count register.

Returns the new expiry value stored in the register.

## Parameters

<i>ulInterval_</i>	Time (in HW-specific) ticks to subtract
--------------------	---

## Returns

Value in ticks stored in the timer's expiry register

Definition at line 84 of file [kerneltimer.cpp](#).

## 16.44.2.6 K\_ULONG KernelTimer::TimeToExpiry ( void ) [static]

Returns the number of ticks remaining before the next timer expiry.

## Returns

Time before next expiry in platform-specific ticks

Definition at line 95 of file [kerneltimer.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/kerneltimer.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/kerneltimer.cpp](#)

## 16.45 KeyEvent\_t Struct Reference

Keyboard UI event structure definition.

```
#include <gui.h>
```

## Public Attributes

- K\_UCHAR [ucKeyCode](#)  
*8-bit value representing a keyboard scan code*

### 16.45.1 Detailed Description

Keyboard UI event structure definition.

Definition at line 80 of file [gui.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/gui.h](#)

## 16.46 LabelControl Class Reference

Inheritance diagram for LabelControl:

## Public Member Functions

- virtual void [Init](#) ()  
*Initialize the control - must be called before use.*
- virtual void [Draw](#) ()  
*Redraw the control "cleanly".*
- virtual [GuiReturn\\_t](#) [ProcessEvent](#) ([GuiEvent\\_t](#) \*pstEvent\_)  
*Process an event sent to the control.*
- virtual void [Activate](#) (bool bActivate\_)  
*Activate or deactivate the current control - used when switching from one active control to another.*
- void [SetBackColor](#) (COLOR eColor\_)
- void [SetFontColor](#) (COLOR eColor\_)
- void [SetFont](#) ([Font\\_t](#) \*pstFont\_)
- void [SetCaption](#) (const K\_CHAR \*pcData\_)

## Private Attributes

- [Font\\_t](#) \* [m\\_pstFont](#)
- const K\_CHAR \* [m\\_pcCaption](#)
- COLOR [m\\_uBackColor](#)
- COLOR [m\\_uFontColor](#)

## Additional Inherited Members

### 16.46.1 Detailed Description

Definition at line 30 of file [control\\_label.h](#).

### 16.46.2 Member Function Documentation

**16.46.2.1** `virtual void LabelControl::Activate ( bool bActivate_ ) [inline], [virtual]`

Activate or deactivate the current control - used when switching from one active control to another.

Parameters

<i>bActivate_</i>	- true to activate, false to deactivate
-------------------	---

Implements [GuiControl](#).

Definition at line 40 of file [control\\_label.h](#).

**16.46.2.2** `void LabelControl::Draw ( ) [virtual]`

Redraw the control "cleanly".

Subclass specific.

Implements [GuiControl](#).

Definition at line 26 of file [control\\_label.cpp](#).

**16.46.2.3** `virtual void LabelControl::Init ( ) [inline], [virtual]`

Initialize the control - must be called before use.

Implementation is subclass specific.

Implements [GuiControl](#).

Definition at line 33 of file [control\\_label.h](#).

**16.46.2.4** `virtual GuiReturn_t LabelControl::ProcessEvent ( GuiEvent_t * pstEvent_ ) [inline], [virtual]`

Process an event sent to the control.

Subclass specific implementation.

Parameters

<i>pstEvent_</i>	Pointer to a struct containing the event data
------------------	---

Implements [GuiControl](#).

Definition at line 39 of file [control\\_label.h](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/control\\_label.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/control\\_label.cpp](#)

## 16.47 LinkList Class Reference

Abstract-data-type from which all other linked-lists are derived.

```
#include <ll.h>
```

Inheritance diagram for LinkList:

### Public Member Functions

- void [Init](#) ()  
*Clear the linked list.*
- virtual void [Add](#) ([LinkListNode](#) \*node\_)=0  
*Add the linked list node to this linked list.*
- virtual void [Remove](#) ([LinkListNode](#) \*node\_)=0  
*Add the linked list node to this linked list.*
- [LinkListNode](#) \* [GetHead](#) ()  
*Get the head node in the linked list.*
- [LinkListNode](#) \* [GetTail](#) ()  
*Get the tail node of the linked list.*

### Protected Attributes

- [LinkListNode](#) \* [m\\_pstHead](#)  
*Pointer to the head node in the list.*
- [LinkListNode](#) \* [m\\_pstTail](#)  
*Pointer to the tail node in the list.*

#### 16.47.1 Detailed Description

Abstract-data-type from which all other linked-lists are derived.

Definition at line 113 of file [ll.h](#).

#### 16.47.2 Member Function Documentation

##### 16.47.2.1 void LinkList::Add( LinkListNode \* node\_ ) [pure virtual]

Add the linked list node to this linked list.

Parameters

---

<i>node_</i>	Pointer to the node to add
--------------	----------------------------

Implemented in [CircularLinkedList](#), [DoubleLinkedList](#), and [ThreadList](#).

#### 16.47.2.2 LinkListNode \* LinkList::GetHead ( ) [inline]

Get the head node in the linked list.

##### Returns

Pointer to the head node in the list

Definition at line 150 of file [ll.h](#).

#### 16.47.2.3 LinkListNode \* LinkList::GetTail ( ) [inline]

Get the tail node of the linked list.

##### Returns

Pointer to the tail node in the list

Definition at line 159 of file [ll.h](#).

#### 16.47.2.4 void LinkList::Remove ( LinkListNode \* node\_ ) [pure virtual]

Add the linked list node to this linked list.

##### Parameters

<i>node_</i>	Pointer to the node to remove
--------------	-------------------------------

Implemented in [CircularLinkedList](#), [DoubleLinkedList](#), and [ThreadList](#).

The documentation for this class was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/ll.h](#)

## 16.48 LinkListNode Class Reference

Basic linked-list node data structure.

```
#include <ll.h>
```

Inheritance diagram for LinkListNode:

## Public Member Functions

- `LinkListNode * GetNext (void)`  
Returns a pointer to the next node in the list.
- `LinkListNode * GetPrev (void)`  
Returns a pointer to the previous node in the list.

## Protected Member Functions

- `void ClearNode ()`  
Initialize the linked list node, clearing its next and previous node.

## Protected Attributes

- `LinkListNode * next`  
Pointer to the next node in the list.
- `LinkListNode * prev`  
Pointer to the previous node in the list.

## Friends

- class `LinkList`
- class `DoubleLinkList`
- class `CircularLinkList`

### 16.48.1 Detailed Description

Basic linked-list node data structure.

This data is managed by the linked-list class types, and can be used transparently between them.

Definition at line 69 of file [ll.h](#).

### 16.48.2 Member Function Documentation

#### 16.48.2.1 `LinkedListNode * LinkedListNode::GetNext ( void ) [inline]`

Returns a pointer to the next node in the list.

##### Returns

a pointer to the next node in the list.

Definition at line 93 of file [ll.h](#).

#### 16.48.2.2 `LinkedListNode * LinkedListNode::GetPrev ( void ) [inline]`

Returns a pointer to the previous node in the list.

##### Returns

a pointer to the previous node in the list.

Definition at line 102 of file [ll.h](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/ll.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/ll.cpp](#)

## 16.49 MemUtil Class Reference

String and Memory manipulation class.

```
#include <memutil.h>
```

### Static Public Member Functions

- static void [DecimalToHex](#) (K\_UCHAR ucData\_, char \*szText\_)  
*Convert an 8-bit unsigned binary value as a hexadecimal string.*
- static void **DecimalToHex** (K\_USHORT usData\_, char \*szText\_)
- static void **DecimalToHex** (K\_ULONG ulData\_, char \*szText\_)
- static void [DecimalToString](#) (K\_UCHAR ucData\_, char \*szText\_)  
*Convert an 8-bit unsigned binary value as a decimal string.*
- static void **DecimalToString** (K\_USHORT usData\_, char \*szText\_)
- static void **DecimalToString** (K\_ULONG ulData\_, char \*szText\_)
- static K\_UCHAR [Checksum8](#) (const void \*pvSrc\_, K\_USHORT usLen\_)  
*Compute the 8-bit additive checksum of a memory buffer.*
- static K\_USHORT [Checksum16](#) (const void \*pvSrc\_, K\_USHORT usLen\_)  
*Compute the 16-bit additive checksum of a memory buffer.*

- static K\_USHORT [StringLength](#) (const char \*szStr\_)  
*Compute the length of a string in bytes.*
- static bool [CompareStrings](#) (const char \*szStr1\_, const char \*szStr2\_)  
*Compare the contents of two zero-terminated string buffers to eachother.*
- static void [CopyMemory](#) (void \*pvDst\_, const void \*pvSrc\_, K\_USHORT usLen\_)  
*Copy one buffer in memory into another.*
- static void [CopyString](#) (char \*szDst\_, const char \*szSrc\_)  
*Copy a string from one buffer into another.*
- static K\_SHORT [StringSearch](#) (const char \*szBuffer\_, const char \*szPattern\_)  
*Search for the presence of one string as a substring within another.*
- static bool [CompareMemory](#) (const void \*pvMem1\_, const void \*pvMem2\_, K\_USHORT usLen\_)  
*Compare the contents of two memory buffers to eachother.*
- static void [SetMemory](#) (void \*pvDst\_, K\_UCHAR ucVal\_, K\_USHORT usLen\_)  
*Initialize a buffer of memory to a specified 8-bit pattern.*
- static K\_UCHAR [Tokenize](#) (const char \*szBuffer\_, [Token\\_t](#) \*pastTokens\_, K\_UCHAR ucMaxTokens\_)  
*Tokenize Function to tokenize a string based on a space delimiter.*

### 16.49.1 Detailed Description

String and Memory manipulation class.

Utility method class implementing common memory and string manipulation functions, without relying on an external standard library implementation which might not be available on some toolchains, may be closed source, or may not be thread-safe.

Definition at line 47 of file [memutil.h](#).

### 16.49.2 Member Function Documentation

16.49.2.1 static K\_USHORT MemUtil::Checksum16 ( const void \* *pvSrc\_*, K\_USHORT *usLen\_* ) [static]

Compute the 16-bit addative checksum of a memory buffer.

Parameters

<i>pvSrc_</i>	Memory buffer to compute a 16-bit checksum of.
<i>usLen_</i>	Length of the buffer in bytes.

Returns

16-bit checksum of the memory block.

Definition at line 215 of file [memutil.cpp](#).

16.49.2.2 static K\_USHORT MemUtil::Checksum8 ( const void \* *pvSrc\_*, K\_USHORT *usLen\_* ) [static]

Compute the 8-bit addative checksum of a memory buffer.

Parameters

<i>pvSrc_</i>	Memory buffer to compute a 8-bit checksum of.
---------------	---

<i>usLen_</i>	Length of the buffer in bytes.
---------------	--------------------------------

**Returns**

8-bit checksum of the memory block.

Definition at line 199 of file [memutil.cpp](#).

**16.49.2.3** static bool MemUtil::CompareMemory ( const void \* *pvMem1\_*, const void \* *pvMem2\_*, K\_USHORT *usLen\_* )  
[static]

Compare the contents of two memory buffers to eachother.

**Parameters**

<i>pvMem1_</i>	First buffer to compare
<i>pvMem2_</i>	Second buffer to compare
<i>usLen_</i>	Length of buffer (in bytes) to compare

**Returns**

true if the buffers match, false if they do not.

Definition at line 342 of file [memutil.cpp](#).

**16.49.2.4** static bool MemUtil::CompareStrings ( const char \* *szStr1\_*, const char \* *szStr2\_* ) [static]

Compare the contents of two zero-terminated string buffers to eachother.

**Parameters**

<i>szStr1_</i>	First string to compare
<i>szStr2_</i>	Second string to compare

**Returns**

true if strings match, false otherwise.

Definition at line 247 of file [memutil.cpp](#).

**16.49.2.5** static void MemUtil::CopyMemory ( void \* *pvDst\_*, const void \* *pvSrc\_*, K\_USHORT *usLen\_* ) [static]

Copy one buffer in memory into another.

**Parameters**

<i>pvDst_</i>	Pointer to the destination buffer
<i>pvSrc_</i>	Pointer to the source buffer
<i>usLen_</i>	Number of bytes to copy from source to destination

Definition at line 273 of file [memutil.cpp](#).

**16.49.2.6** static void MemUtil::CopyString ( char \* *szDst\_*, const char \* *szSrc\_* ) [static]

Copy a string from one buffer into another.

## Parameters

<i>szDst_</i>	Pointer to the buffer to copy into
<i>szSrc_</i>	Pointer to the buffer to copy data from

Definition at line 290 of file [memutil.cpp](#).

16.49.2.7 static void MemUtil::DecimalToHex ( K\_UCHAR *ucData\_*, char \* *szText\_* ) [static]

Convert an 8-bit unsigned binary value as a hexadecimal string.

## Parameters

<i>ucData_</i>	Value to convert into a string
<i>szText_</i>	Destination string buffer (3 bytes minimum)

Definition at line 28 of file [memutil.cpp](#).

16.49.2.8 static void MemUtil::DecimalToString ( K\_UCHAR *ucData\_*, char \* *szText\_* ) [static]

Convert an 8-bit unsigned binary value as a decimal string.

## Parameters

<i>ucData_</i>	Value to convert into a string
<i>szText_</i>	Destination string buffer (4 bytes minimum)

Definition at line 122 of file [memutil.cpp](#).

16.49.2.9 static void MemUtil::SetMemory ( void \* *pvDst\_*, K\_UCHAR *ucVal\_*, K\_USHORT *usLen\_* ) [static]

Initialize a buffer of memory to a specified 8-bit pattern.

## Parameters

<i>pvDst_</i>	Destination buffer to set
<i>ucVal_</i>	8-bit pattern to initialize each byte of destination with
<i>usLen_</i>	Length of the buffer (in bytes) to initialize

Definition at line 363 of file [memutil.cpp](#).

16.49.2.10 static K\_USHORT MemUtil::StringLength ( const char \* *szStr\_* ) [static]

Compute the length of a string in bytes.

## Parameters

<i>szStr_</i>	Pointer to the zero-terminated string to calculate the length of
---------------	--

## Returns

length of the string (in bytes), not including the 0-terminator.

Definition at line 232 of file [memutil.cpp](#).

16.49.2.11 static K\_SHORT MemUtil::StringSearch ( const char \* *szBuffer\_*, const char \* *szPattern\_* ) [static]

Search for the presence of one string as a substring within another.

## Parameters

<i>szBuffer_</i>	Buffer to search for pattern within
<i>szPattern_</i>	Pattern to search for in the buffer

## Returns

Index of the first instance of the pattern in the buffer, or -1 on no match.

Definition at line 307 of file [memutil.cpp](#).

16.49.2.12 `K_UCHAR MemUtil::Tokenize ( const char * szBuffer_, Token_t * pastTokens_, K_UCHAR ucMaxTokens_ )`  
`[static]`

Tokenize Function to tokenize a string based on a space delimiter.

This is a non-destructive function, which populates a [Token\\_t](#) descriptor array.

## Parameters

<i>szBuffer_</i>	String to tokenize
<i>pastTokens_</i>	Pointer to the array of token descriptors
<i>ucMaxTokens_</i>	Maximum number of tokens to parse (i.e. size of <i>pastTokens_</i> )

## Returns

Count of tokens parsed

Definition at line 376 of file [memutil.cpp](#).

The documentation for this class was generated from the following files:

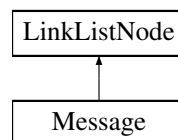

- [/home/moslevin/mark3-source/embedded/stage/src/memutil.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/memutil.cpp](#)

## 16.50 Message Class Reference

Class to provide message-based IPC services in the kernel.

```
#include <message.h>
```

Inheritance diagram for Message:

### Public Member Functions

- void [Init](#) ()  
*Initialize the data and code in the message.*
- void [SetData](#) (void \*pvData\_)  
*Set the data pointer for the message before transmission.*
- void \* [GetData](#) ()

- *Get the data pointer stored in the message upon receipt.*  
void [SetCode](#) (K\_USHORT usCode\_)
- *Set the code in the message before transmission.*  
K\_USHORT [GetCode](#) ()
- *Return the code set in the message upon receipt.*

### Private Attributes

- void \* [m\\_pvData](#)  
*Pointer to the message data.*
- K\_USHORT [m\\_usCode](#)  
*Message code, providing context for the message.*

### Additional Inherited Members

#### 16.50.1 Detailed Description

Class to provide message-based IPC services in the kernel.

Definition at line 99 of file [message.h](#).

#### 16.50.2 Member Function Documentation

##### 16.50.2.1 K\_USHORT Message::GetCode ( ) [inline]

Return the code set in the message upon receipt.

##### Returns

User code set in the object

Definition at line 143 of file [message.h](#).

##### 16.50.2.2 void \* Message::GetData ( ) [inline]

Get the data pointer stored in the message upon receipt.

##### Returns

Pointer to the data set in the message object

Definition at line 125 of file [message.h](#).

##### 16.50.2.3 Message::SetCode ( K\_USHORT usCode\_ ) [inline]

Set the code in the message before transmission.

##### Parameters

<i>usCode_</i>	Data code to set in the object
----------------	--------------------------------

Definition at line 134 of file [message.h](#).

##### 16.50.2.4 void Message::SetData ( void \* pvData\_ ) [inline]

Set the data pointer for the message before transmission.

## Parameters

<code>pvData_</code>	Pointer to the data object to send in the message
----------------------	---

Definition at line 116 of file [message.h](#).

The documentation for this class was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/message.h](#)

## 16.51 MessageQueue Class Reference

List of messages, used as the channel for sending and receiving messages between threads.

```
#include <message.h>
```

### Public Member Functions

- `void Init ()`  
*Initialize the message queue prior to use.*
- `Message * Receive ()`  
*Receive a message from the message queue.*
- `Message * Receive (K_ULONG ulTimeWaitMS_)`  
*Receive a message from the message queue.*
- `void Send (Message *pclSrc_)`  
*Send a message object into this message queue.*
- `K_USHORT GetCount ()`  
*Return the number of messages pending in the "receive" queue.*

### Private Attributes

- `Semaphore m_clSemaphore`  
*Counting semaphore used to manage thread blocking.*
- `DoubleLinkedList m_clLinkList`  
*List object used to store messages.*

#### 16.51.1 Detailed Description

List of messages, used as the channel for sending and receiving messages between threads.

Definition at line 201 of file [message.h](#).

#### 16.51.2 Member Function Documentation

##### 16.51.2.1 K\_USHORT MessageQueue::GetCount ( )

Return the number of messages pending in the "receive" queue.

#### Returns

Count of pending messages in the queue.

Definition at line 149 of file [message.cpp](#).

**16.51.2.2 Message \* MessageQueue::Receive ( )**

Receive a message from the message queue.

If the message queue is empty, the thread will block until a message is available.

**Returns**

Pointer to a message object at the head of the queue

Definition at line 91 of file [message.cpp](#).

**16.51.2.3 Message \* MessageQueue::Receive ( K\_ULONG ulWaitTimeMS\_ )**

Receive a message from the message queue.

If the message queue is empty, the thread will block until a message is available for the duration specified. If no message arrives within that duration, the call will return with NULL.

**Parameters**

<i>ulWaitTimeMS_</i>	The amount of time in ms to wait for a message before timing out and unblocking the waiting thread.
----------------------	---

**Returns**

Pointer to a message object at the head of the queue or NULL on timeout.

Definition at line 111 of file [message.cpp](#).

**16.51.2.4 void MessageQueue::Send ( Message \* pclSrc\_ )**

Send a message object into this message queue.

Will un-block the first waiting thread blocked on this queue if that occurs.

**Parameters**

<i>pclSrc_</i>	Pointer to the message object to add to the queue
----------------	---

Definition at line 133 of file [message.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/message.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/message.cpp](#)

**16.52 MouseEvent\_t Struct Reference**

Mouse UI event structure.

```
#include <gui.h>
```

**Public Attributes**

- K\_USHORT [usX](#)  
*absolute X location of the mouse (pixel)*
- K\_USHORT [usY](#)

*absolute Y location of the mouse (pixel)*

### 16.52.1 Detailed Description

Mouse UI event structure.

Definition at line 102 of file [gui.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/gui.h](#)

## 16.53 Mutex Class Reference

Mutual-exclusion locks, based on [BlockingObject](#).

```
#include <mutex.h>
```

Inheritance diagram for Mutex:

### Public Member Functions

- void [Init](#) ()  
*Initialize a mutex object for use - must call this function before using the object.*
- void [Claim](#) ()  
*Claim the mutex.*
- bool [Claim](#) (K\_ULONG ulWaitTimeMS\_)
- void [Timeout](#) (Thread \*pclOwner\_)  
*Wake a thread blocked on the mutex.*
- void [Release](#) ()  
*Release the mutex.*

### Private Member Functions

- K\_UCHAR [WakeNext](#) ()  
*Wake the next thread waiting on the [Mutex](#).*
- K\_BOOL [ProcessQueue](#) ()
- void [ClaimTransaction](#) (Transaction \*pclTRX\_, K\_BOOL \*pbReschedule\_)  
*ClaimTransaction.*
- void [ReleaseTransaction](#) (Transaction \*pclTRX\_, K\_BOOL \*pbReschedule\_)  
*ReleaseTransaction.*
- void [TimeoutTransaction](#) (Transaction \*pclTRX\_, K\_BOOL \*pbReschedule\_)  
*TimeoutTransaction.*

## Private Attributes

- K\_UCHAR [m\\_ucRecurse](#)  
*The recursive lock-count when a mutex is claimed multiple times by the same owner.*
- K\_UCHAR [m\\_bReady](#)  
*State of the mutex - true = ready, false = claimed.*
- K\_UCHAR [m\\_ucMaxPri](#)  
*Maximum priority of thread in queue, used for priority inheritance.*
- Thread \* [m\\_pclOwner](#)  
*Pointer to the thread that owns the mutex (when claimed)*

## Additional Inherited Members

### 16.53.1 Detailed Description

Mutual-exclusion locks, based on [BlockingObject](#).

Definition at line 69 of file [mutex.h](#).

### 16.53.2 Member Function Documentation

#### 16.53.2.1 void Mutex::Claim ( )

Claim the mutex.

When the mutex is claimed, no other thread can claim a region protected by the object.

Definition at line 282 of file [mutex.cpp](#).

#### 16.53.2.2 bool Mutex::Claim ( K\_ULONG ulWaitTimeMS\_ )

##### Parameters

<a href="#">ulWaitTimeMS_</a>	
-------------------------------	--

##### Returns

true - mutex was claimed within the time period specified  
false - mutex operation timed-out before the claim operation.

Definition at line 286 of file [mutex.cpp](#).

#### 16.53.2.3 void Mutex::ClaimTransaction ( Transaction \* [pclTRX\\_](#), K\_BOOL \* [pbReschedule\\_](#) ) [private]

ClaimTransaction.

Perform a mutex Claim (Lock) operation, as specified from an object on the transaction queue.

##### Parameters

<a href="#">pclTRX_</a>	- Pointer to the transaction object
<a href="#">pbReschedule_</a>	- Pointer to boolean to be set true if rescheduling is required.

Definition at line 115 of file [mutex.cpp](#).

## 16.53.2.4 void Mutex::Release ( )

Release the mutex.

When the mutex is released, another object can enter the mutex-protected region.

Definition at line 325 of file [mutex.cpp](#).

16.53.2.5 void Mutex::ReleaseTransaction ( Transaction \* *pciTRX\_*, K\_BOOL \* *pbReschedule\_* ) [private]

ReleaseTransaction.

Perform a [Mutex](#) Release/Unlock operation, as specified from an object on the transaction queue.

Parameters

<i>pciTRX_</i>	- Pointer to the transaction object
<i>pbReschedule_</i>	- Pointer to boolean to be set true if rescheduling is required.

Definition at line 185 of file [mutex.cpp](#).

16.53.2.6 void Mutex::Timeout ( Thread \* *pciOwner\_* )

Wake a thread blocked on the mutex.

This is an internal function used for implementing timed mutexes relying on timer callbacks. Since these do not have access to the private data of the mutex and its base classes, we have to wrap this as a public method - do not use this for any other purposes.

Parameters

<i>pciOwner_</i>	<a href="#">Thread</a> to unblock from this object.
------------------	---

Definition at line 55 of file [mutex.cpp](#).

16.53.2.7 void Mutex::TimeoutTransaction ( Transaction \* *pciTRX\_*, K\_BOOL \* *pbReschedule\_* ) [private]

TimeoutTransaction.

Perform a [Mutex](#) "timeout" operation, as specified from an object on the transaction queue.

Parameters

<i>pciTRX_</i>	- Pointer to the transaction object
<i>pbReschedule_</i>	- Pointer to boolean to be set true if rescheduling is required.

Definition at line 233 of file [mutex.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/mutex.cpp](#)

## 16.54 NLFS Class Reference

Nice Little File System class.

```
#include <nlfs.h>
```

Inheritance diagram for NLFS:

## Public Member Functions

- void [Format](#) ([NLFS\\_Host\\_t](#) \*puHost\_, K\_ULONG ulTotalSize\_, K\_USHORT usNumFiles\_, K\_USHORT us-DataBlockSize\_)  
*Format/Create a new filesystem with the configuration specified in the parameters.*
- void [Mount](#) ([NLFS\\_Host\\_t](#) \*puHost\_)  
*Re-mount a previously-created filesystem using this FS object.*
- K\_USHORT [Create\\_File](#) (const K\_CHAR \*szPath\_)  
*Create\_File creates a new file object at the specified path.*
- K\_USHORT [Create\\_Dir](#) (const K\_CHAR \*szPath\_)  
*Create\_Dir creates a new directory at the specified path.*
- K\_USHORT [Delete\\_File](#) (const K\_CHAR \*szPath\_)  
*Delete\_File Removes a file from disk.*
- K\_USHORT [Delete\\_Folder](#) (const K\_CHAR \*szPath\_)  
*Delete\_Folder Remove a folder from disk.*
- void [Cleanup\\_Node\\_Links](#) (K\_USHORT usNode\_, [NLFS\\_Node\\_t](#) \*pstNode\_)  
*Cleanup\_Node\_Links Remove the links between the given node and its parent/peer nodes.*
- K\_USHORT [Find\\_Parent\\_Dir](#) (const K\_CHAR \*szPath\_)  
*Find\_Parent\_Dir returns the directory under which the specified file object lives.*
- K\_USHORT [Find\\_File](#) (const K\_CHAR \*szPath\_)  
*Find\_File returns the file node ID of the object at a given path.*
- void [Print](#) (void)  
*Print displays a summary of files in the filesystem.*
- K\_ULONG [GetBlockSize](#) (void)  
*GetBlockSize retrieves the data block size for the filesystem.*
- K\_ULONG [GetNumBlocks](#) (void)  
*GetNumBlocks retrieves the number of data blocks in the filesystem.*
- K\_ULONG [GetNumBlocksFree](#) (void)  
*GetNumBlocksFree retrieves the number of free data blocks in the filesystem.*
- K\_ULONG [GetNumFiles](#) (void)  
*GetNumFiles retrieves the maximum number of files in the filesystem.*
- K\_USHORT [GetNumFilesFree](#) (void)  
*GetNumFilesFree retrieves the number of free blocks in the filesystem.*
- K\_USHORT [GetFirstChild](#) (K\_USHORT usNode\_)  
*GetFirstChild Return the first child node for a node representing a directory.*
- K\_USHORT [GetNextPeer](#) (K\_USHORT usNode\_)  
*GetNextPeer Return the Node ID of a File/Directory's next peer.*
- K\_BOOL [GetStat](#) (K\_USHORT usNode\_, [NLFS\\_File\\_Stat\\_t](#) \*pstStat\_)  
*GetStat Get the status of a file on-disk.*

## Protected Member Functions

- K\_CHAR [Find\\_Last\\_Slash](#) (const K\_CHAR \*szPath\_)  
*Find\_Last\_Slash Finds the location of the last '/' character in a path.*
- K\_BOOL [File\\_Names\\_Match](#) (const K\_CHAR \*szPath\_, [NLFS\\_Node\\_t](#) \*pstNode\_)  
*File\_Names\_Match Determines if a given path matches the name in a file node.*
- virtual void [Read\\_Node](#) (K\_USHORT usNode\_, [NLFS\\_Node\\_t](#) \*pstNode\_)=0  
*Read\_Node is an implementation-specific method used to read a file node from physical storage into a local data structure.*
- virtual void [Write\\_Node](#) (K\_USHORT usNode\_, [NLFS\\_Node\\_t](#) \*pstNode\_)=0  
*Write\_Node is an implementation-specific method used to write a file node from a local structure back to the physical storage.*
- virtual void [Read\\_Block\\_Header](#) (K\_ULONG ulBlock\_, [NLFS\\_Block\\_t](#) \*pstBlock\_)=0  
*Read\_Block\_Header is an implementation-specific method used to read a file block header from physical storage into a local struct.*
- virtual void [Write\\_Block\\_Header](#) (K\_ULONG ulBlock\_, [NLFS\\_Block\\_t](#) \*pstFileBlock\_)=0  
*Write\_Block\_Header is an implementation-specific method used to write a file block header back to physical storage from a local struct.*
- virtual void [Read\\_Block](#) (K\_ULONG ulBlock\_, K\_ULONG ulOffset\_, void \*pvData\_, K\_ULONG ulLen\_)=0  
*Read\_Block is an implementation-specific method used to read raw file data from physical storage into a local buffer.*
- virtual void [Write\\_Block](#) (K\_ULONG ulBlock\_, K\_ULONG ulOffset\_, void \*pvData\_, K\_ULONG ulLen\_)=0  
*Write\_Block is an implementation-specific method used to write a piece of file data to its data block in the underlying physical storage.*
- void [RootSync](#) ()  
*RootSync Synchronize the filesystem config in the object back to the underlying storage mechanism.*
- void [Repair](#) ()  
*Repair Checks a filesystem for inconsistencies and makes repairs in order to avoid losing storage blocks.*
- void [Print\\_Free\\_Details](#) (K\_USHORT usNode\_)  
*Print\_Free\_Details Print details about a free node.*
- void [Print\\_File\\_Details](#) (K\_USHORT usNode\_)  
*Print\_File\_Details displays information about a given file node.*
- void [Print\\_Dir\\_Details](#) (K\_USHORT usNode\_)  
*Print\_Dir\_Details displays information about a given directory node.*
- void [Print\\_Node\\_Details](#) (K\_USHORT usNode\_)  
*Print\_Node\_Details prints details about a node, the details differ based on whether it's a file/directory/root node.*
- void [Push\\_Free\\_Node](#) (K\_USHORT usNode\_)  
*Push\_Free\_Node returns a file node back to the free node list.*
- K\_USHORT [Pop\\_Free\\_Node](#) (void)  
*Pop\_Free\_Node returns the first free file node in the free list.*
- void [Push\\_Free\\_Block](#) (K\_ULONG ulBlock\_)  
*Push\_Free\_Block returns a file block back to the head of the free block list.*
- K\_ULONG [Pop\\_Free\\_Block](#) (void)  
*Pop\_Free\_Block pops a file data block from the head of the free list.*
- K\_ULONG [Append\\_Block\\_To\\_Node](#) ([NLFS\\_Node\\_t](#) \*pstFile\_)  
*Append\_Block\_To\_Node adds a file data block to the end of a file.*
- K\_USHORT [Create\\_File\\_i](#) (const K\_CHAR \*szPath\_, [NLFS\\_Type\\_t](#) eType\_)  
*Create\_File\_i is the private method used to create a file or directory.*
- void [Set\\_Node\\_Name](#) ([NLFS\\_Node\\_t](#) \*pstFileNode\_, const K\_CHAR \*szPath\_)  
*Set\_Node\_Name sets the name of a file or directory node.*

## Protected Attributes

- [NLFS\\_Host\\_t \\* m\\_puHost](#)  
*Local, cached copy of host FS pointer.*
- [NLFS\\_Root\\_Node\\_t m\\_stLocalRoot](#)  
*Local, cached copy of root.*

## Friends

- class **NLFS\_File**

### 16.54.1 Detailed Description

Nice Little File System class.

Definition at line 280 of file [nlfs.h](#).

### 16.54.2 Member Function Documentation

#### 16.54.2.1 K\_ULONG NLFS::Append\_Block\_To\_Node ( NLFS\_Node\_t \* *pstFile\_* ) [protected]

Append\_Block\_To\_Node adds a file data block to the end of a file.

##### Parameters

in	<i>pstFile_</i>	- Pointer to the file node to add a block to
----	-----------------	--

##### Returns

Data block ID of the allocated block, or INVALID\_BLOCK on failure.

Definition at line 245 of file [nlfs.cpp](#).

#### 16.54.2.2 void NLFS::Cleanup\_Node\_Links ( K\_USHORT *usNode\_*, NLFS\_Node\_t \* *pstNode\_* )

Cleanup\_Node\_Links Remove the links between the given node and its parent/peer nodes.

##### Parameters

<i>usNode_</i>	Index of the node
<i>pstNode_</i>	Pointer to a local copy of the node data

Definition at line 598 of file [nlfs.cpp](#).

#### 16.54.2.3 K\_USHORT NLFS::Create\_Dir ( const K\_CHAR \* *szPath\_* )

Create\_Dir creates a new directory at the specified path.

##### Parameters

in	<i>szPath_</i>	- Path to the directory to create
----	----------------	-----------------------------------

##### Returns

ID of the created dir, or INVALID\_NODE if the path cannot be resolved, or the file already exists.

Definition at line 586 of file [nlfs.cpp](#).

#### 16.54.2.4 K\_USHORT NLFS::Create\_File ( const K\_CHAR \* *szPath\_* )

Create\_File creates a new file object at the specified path.

**Parameters**

<i>in</i>	<i>szPath_</i>	- Path to the file to create
-----------	----------------	------------------------------

**Returns**

ID of the created file, or INVALID\_NODE if the path cannot be resolved, or the file already exists.

Definition at line 573 of file [nlfs.cpp](#).

16.54.2.5 K\_USHORT NLFS::Create\_File\_i ( const K\_CHAR \* *szPath\_*, NLFS\_Type\_t *eType\_* ) [protected]

Create\_File\_i is the private method used to create a file or directory.

**Parameters**

<i>in</i>	<i>szPath_</i>	- Path of the file or directory to create
<i>in</i>	<i>eType_</i>	- Type of file to create

**Returns**

File node ID of the newly created file, or INVALID\_NODE on failure.

! ToDo - set real user/group IDs

Definition at line 490 of file [nlfs.cpp](#).

16.54.2.6 K\_USHORT NLFS::Delete\_File ( const K\_CHAR \* *szPath\_* )

Delete\_File Removes a file from disk.

**Parameters**

<i>szPath_</i>	Path of the file to remove
----------------	----------------------------

**Returns**

Index of the node deleted or INVALID\_NODE on error

Definition at line 705 of file [nlfs.cpp](#).

16.54.2.7 K\_USHORT NLFS::Delete\_Folder ( const K\_CHAR \* *szPath\_* )

Delete\_Folder Remove a folder from disk.

**Parameters**

<i>szPath_</i>	Path of the folder to remove
----------------	------------------------------

**Returns**

Index of the node deleted or INVALID\_NODE on error

Definition at line 662 of file [nlfs.cpp](#).

16.54.2.8 K\_BOOL NLFS::File\_Names\_Match ( const K\_CHAR \* *szPath\_*, NLFS\_Node\_t \* *pstNode\_* ) [protected]

File\_Names\_Match Determines if a given path matches the name in a file node.

## Parameters

in	<i>szPath_</i>	- file path to search for
in	<i>pstNode_</i>	- pointer to a fs node

## Returns

true if the filename in the path matches the filename in the node.

Definition at line 42 of file [nlfs.cpp](#).

16.54.2.9 K\_USHORT NLFS::Find\_File ( const K\_CHAR \* *szPath\_* )

Find\_File returns the file node ID of the object at a given path.

## Parameters

in	<i>szPath_</i>	- Path of the file to search for
----	----------------	----------------------------------

## Returns

file node ID, or INVALID\_NODE if the path is invalid.

Definition at line 405 of file [nlfs.cpp](#).

16.54.2.10 K\_CHAR NLFS::Find\_Last\_Slash ( const K\_CHAR \* *szPath\_* ) [protected]

Find\_Last\_Slash Finds the location of the last '/' character in a path.

## Parameters

in	<i>szPath_</i>	- String representing a '/' delimited path.
----	----------------	---

## Returns

the byte offset of the last slash char in the path.

Definition at line 26 of file [nlfs.cpp](#).

16.54.2.11 K\_USHORT NLFS::Find\_Parent\_Dir ( const K\_CHAR \* *szPath\_* )

Find\_Parent\_Dir returns the directory under which the specified file object lives.

## Parameters

in	<i>szPath_</i>	- Path of the file to find parent directory node for
----	----------------	--

## Returns

directory node ID, or INVALID\_NODE if the path is invalid.

Definition at line 289 of file [nlfs.cpp](#).

16.54.2.12 void NLFS::Format ( NLFS\_Host\_t \* *puHost\_*, K\_ULONG *ulTotalSize\_*, K\_USHORT *usNumFiles\_*, K\_USHORT *usDataBlockSize\_* )

Format/Create a new filesystem with the configuration specified in the parameters.

## Parameters

in	<i>puHost_</i>	- Pointer to the FS storage object, interpreted by the physical medium driver.
in	<i>ulTotalSize_</i>	- Total size of the object to format (in bytes)
in	<i>usNumFiles_</i>	- Number of file nodes to create in the FS. This parameter determines the maximum number of files and directories that can exist simultaneously in the filesystem. All filesystem storage not allocated towards file nodes is automatically used as data-blocks.
	<i>usDataBlock-Size_</i>	- Size of each data block (in bytes). Setting a lower block size is a good way to avoid wasting space in small-files due to over-allocation of storage (size on-disk vs. actual file size). However, each block requires a metadata object, which can also add to overhead. Also, file read/write speed can vary significantly based on the block size - in many scenarios, larger blocks can lead to higher throughput.

Definition at line 756 of file [nlfs.cpp](#).

16.54.2.13 `K_ULONG NLFS::GetBlockSize ( void ) [inline]`

GetBlockSize retrieves the data block size for the filesystem.

## Returns

The size of a data block in the filesystem, as configured at format.

Definition at line 382 of file [nlfs.h](#).

16.54.2.14 `K_USHORT NLFS::GetFirstChild ( K_USHORT usNode_ )`

GetFirstChild Return the first child node for a node representing a directory.

## Parameters

<i>usNode_</i>	Index of a directory node
----------------	---------------------------

## Returns

Node ID of the first child node or INVALID\_NODE on failure

Definition at line 890 of file [nlfs.cpp](#).

16.54.2.15 `K_USHORT NLFS::GetNextPeer ( K_USHORT usNode_ )`

GetNextPeer Return the Node ID of a File/Directory's next peer.

## Parameters

<i>usNode_</i>	Node index of the current object
----------------	----------------------------------

## Returns

Node ID of the next peer object

Definition at line 908 of file [nlfs.cpp](#).

16.54.2.16 `K_ULONG NLFS::GetNumBlocks ( void ) [inline]`

GetNumBlocks retrieves the number of data blocks in the filesystem.

**Returns**

The total number of blocks in the filesystem

Definition at line 388 of file [nlfs.h](#).

**16.54.2.17** `K_ULONG NLFS::GetNumBlocksFree ( void ) [inline]`

GetNumBlocksFree retrieves the number of free data blocks in the filesystem.

**Returns**

The number of available blocks in the filesystem

Definition at line 395 of file [nlfs.h](#).

**16.54.2.18** `K_ULONG NLFS::GetNumFiles ( void ) [inline]`

GetNumFiles retrieves the maximum number of files in the filesystem.

**Returns**

The maximum number of files that can be allocated in the system

Definition at line 401 of file [nlfs.h](#).

**16.54.2.19** `K_USHORT NLFS::GetNumFilesFree ( void ) [inline]`

GetNumFilesFree retrieves the number of free blocks in the filesystem.

**Returns**

The number of free file nodes in the filesystem

Definition at line 407 of file [nlfs.h](#).

**16.54.2.20** `K_BOOL NLFS::GetStat ( K_USHORT usNode_, NLFS_File_Stat_t * pstStat_ )`

GetStat Get the status of a file on-disk.

**Parameters**

<i>usNode_</i>	Node representing the file
<i>pstStat_</i>	Pointer to the object containing the status

**Returns**

true on success, false on failure

Definition at line 920 of file [nlfs.cpp](#).

**16.54.2.21** `void NLFS::Mount ( NLFS_Host_t * puHost_ )`

Re-mount a previously-created filesystem using this FS object.

**Parameters**

<i>in</i>	<i>puHost_</i>	- Pointer to the filesystem object
-----------	----------------	------------------------------------

! Must set the host pointer first.

Definition at line 859 of file [nlfs.cpp](#).

#### 16.54.2.22 K\_ULONG NLFS::Pop\_Free\_Block ( void ) [protected]

Pop\_Free\_Block pops a file data block from the head of the free list.

**Returns**

the block index of the file node popped from the head of the free block list

Definition at line 192 of file [nlfs.cpp](#).

#### 16.54.2.23 K\_USHORT NLFS::Pop\_Free\_Node ( void ) [protected]

Pop\_Free\_Node returns the first free file node in the free list.

**Returns**

the index of the file node popped off the free list

Definition at line 145 of file [nlfs.cpp](#).

#### 16.54.2.24 void NLFS::Print\_Dir\_Details ( K\_USHORT *usNode\_* ) [protected]

Print\_Dir\_Details displays information about a given directory node.

**Parameters**

<i>in</i>	<i>usNode_</i>	- directory index to display details for
-----------	----------------	--

Definition at line 90 of file [nlfs.cpp](#).

#### 16.54.2.25 void NLFS::Print\_File\_Details ( K\_USHORT *usNode\_* ) [protected]

Print\_File\_Details displays information about a given file node.

**Parameters**

<i>in</i>	<i>usNode_</i>	- file index to display details for
-----------	----------------	-------------------------------------

Definition at line 68 of file [nlfs.cpp](#).

#### 16.54.2.26 void NLFS::Print\_Free\_Details ( K\_USHORT *usNode\_* ) [protected]

Print\_Free\_Details Print details about a free node.

**Parameters**

<i>usNode_</i>	Node to print details for
----------------	---------------------------

Definition at line 106 of file [nlfs.cpp](#).

#### 16.54.2.27 void NLFS::Print\_Node\_Details ( K\_USHORT *usNode\_* ) [protected]

Print\_Node\_Details prints details about a node, the details differ based on whether it's a file/directory/root node.

## Parameters

in	<i>usNode_</i>	- node to show details for
----	----------------	----------------------------

Definition at line 115 of file [nlfs.cpp](#).

**16.54.2.28** void NLFS::Push\_Free\_Block ( K\_ULONG *ulBlock\_* ) [protected]

Push\_Free\_Block returns a file block back to the head of the free block list.

## Parameters

in	<i>ulBlock_</i>	- index of the data block to free
----	-----------------	-----------------------------------

Definition at line 224 of file [nlfs.cpp](#).

**16.54.2.29** void NLFS::Push\_Free\_Node ( K\_USHORT *usNode\_* ) [protected]

Push\_Free\_Node returns a file node back to the free node list.

## Parameters

in	<i>usNode_</i>	- index of the file node to push back to the free list.
----	----------------	---

Definition at line 172 of file [nlfs.cpp](#).

**16.54.2.30** virtual void NLFS::Read\_Block ( K\_ULONG *ulBlock\_*, K\_ULONG *ulOffset\_*, void \* *pvData\_*, K\_ULONG *ulLen\_* ) [protected], [pure virtual]

Read\_Block is an implementation-specific method used to read raw file data from physical storage into a local buffer.

## Parameters

in	<i>ulBlock_</i>	- filesystem block ID corresponding to the file
in	<i>ulOffset_</i>	- offset (in bytes) from the beginning of the block
out	<i>pvData_</i>	- output buffer to read into
in	<i>ulLen_</i>	- length of data to read (in bytes)

Implemented in [NLFS\\_RAM](#).

**16.54.2.31** virtual void NLFS::Read\_Block\_Header ( K\_ULONG *ulBlock\_*, NLFS\_Block\_t \* *pstBlock\_* ) [protected], [pure virtual]

Read\_Block\_Header is an implementation-specific method used to read a file block header from physical storage into a local struct.

## Parameters

in	<i>ulBlock_</i>	- data block index
out	<i>pstBlock_</i>	- block header structure to read into

Implemented in [NLFS\\_RAM](#).

**16.54.2.32** virtual void NLFS::Read\_Node ( K\_USHORT *usNode\_*, NLFS\_Node\_t \* *pstNode\_* ) [protected], [pure virtual]

Read\_Node is an implementation-specific method used to read a file node from physical storage into a local data structure.

## Parameters

in	<i>usNode_</i>	- File node index
out	<i>pstNode_</i>	- Pointer to the file node object to read into

Implemented in [NLFS\\_RAM](#).

**16.54.2.33** void NLFS::RootSync ( ) [protected]

RootSync Synchronize the filesystem config in the object back to the underlying storage mechanism.

This needs to be called to ensure that underlying storage is kept consistent when creating or deleting files.

Definition at line 879 of file [nlfs.cpp](#).

**16.54.2.34** void NLFS::Set\_Node\_Name ( NLFS\_Node\_t \* *pstFileNode\_*, const K\_CHAR \* *szPath\_* ) [protected]

Set\_Node\_Name sets the name of a file or directory node.

## Parameters

in	<i>pstFileNode_</i>	- Pointer to a file node structure to name
in	<i>szPath_</i>	- Name for the file

Definition at line 458 of file [nlfs.cpp](#).

**16.54.2.35** virtual void NLFS::Write\_Block ( K\_ULONG *ulBlock\_*, K\_ULONG *ulOffset\_*, void \* *pvData\_*, K\_ULONG *ulLen\_* )  
[protected],[pure virtual]

Write\_Block is an implementation-specific method used to write a piece of file data to its data block in the underlying physical storage.

## Parameters

in	<i>ulBlock_</i>	- filesystem block ID corresponding to the file
in	<i>ulOffset_</i>	- offset (in bytes) from the beginning of the block
in	<i>pvData_</i>	- data buffer to write to disk
in	<i>ulLen_</i>	- length of data to write (in bytes)

Implemented in [NLFS\\_RAM](#).

**16.54.2.36** virtual void NLFS::Write\_Block\_Header ( K\_ULONG *ulBlock\_*, NLFS\_Block\_t \* *pstFileBlock\_* )  
[protected],[pure virtual]

Write\_Block\_Header is an implementation-specific method used to write a file block header back to physical storage from a local struct.

## Parameters

in	<i>ulBlock_</i>	- data block index
in	<i>pstFileBlock_</i>	- pointer to the local data structure to write from

Implemented in [NLFS\\_RAM](#).

**16.54.2.37** virtual void NLFS::Write\_Node ( K\_USHORT *usNode\_*, NLFS\_Node\_t \* *pstNode\_* ) [protected],[pure virtual]

Write\_Node is an implementation-specific method used to write a file node from a local structure back to the physical storage.

## Parameters

in	<i>usNode_</i>	- File node index
in	<i>pstNode_</i>	- Pointer to the file node object to write from

Implemented in [NLFS\\_RAM](#).

The documentation for this class was generated from the following files:

## 16.56 NLFS\_File Class Reference

The [NLFS\\_File](#) class.

```
#include <nlfs_file.h>
```

### Public Member Functions

- [int](#) [Open](#) ([NLFS](#) \*pclFS\_, const [K\\_CHAR](#) \*szPath\_, [NLFS\\_File\\_Mode\\_t](#) eMode\_)  
*Open Opens a file from a given filesystem.*
- [int](#) [Read](#) (void \*pvBuf\_, [K\\_ULONG](#) ulLen\_)  
*Read Read bytes from a file into a specified data buffer.*
- [int](#) [Write](#) (void \*pvBuf\_, [K\\_ULONG](#) ulLen\_)  
*Write Write a specified blob of data to the file.*
- [int](#) [Seek](#) ([K\\_ULONG](#) ulOffset\_)  
*Seek Seek to the specified byte offset within the file.*
- [int](#) [Close](#) (void)  
*Close Is used to close an open file buffer.*

## Private Attributes

- [NLFS \\* m\\_pclFileSystem](#)  
*Pointer to the host filesystem.*
- [K\\_ULONG m\\_ulOffset](#)  
*Current byte offset within the file.*
- [K\\_ULONG m\\_ulCurrentBlock](#)  
*Index of the current filesystem block.*
- [K\\_USHORT m\\_usFile](#)  
*File index of the current file.*
- [NLFS\\_File\\_Mode\\_t m\\_ucFlags](#)  
*File mode flags.*
- [NLFS\\_Node\\_t m\\_stNode](#)  
*Local copy of the file node.*

### 16.56.1 Detailed Description

The [NLFS\\_File](#) class.

This class contains an implementation of file-level access built on-top of the [NLFS](#) filesystem architecture. An instance of this class represents an active/open file from inside the NLFSfilesystem.

Definition at line 45 of file [nlfs\\_file.h](#).

### 16.56.2 Member Function Documentation

#### 16.56.2.1 int NLFS\_File::Close ( void )

Close Is used to close an open file buffer.

##### Returns

0 on success, -1 on failure.

Definition at line 272 of file [nlfs\\_file.cpp](#).

#### 16.56.2.2 int NLFS\_File::Open ( NLFS \* pclFS\_, const K\_CHAR \* szPath\_, NLFS\_File\_Mode\_t eMode\_ )

Open Opens a file from a given filesystem.

##### Parameters

<i>pcIFs_</i>	- Pointer to the <a href="#">NLFS</a> filesystem containing the file
<i>szPath_</i>	- Path to the file within the <a href="#">NLFS</a> filesystem
<i>eMode_</i>	- File open mode

##### Returns

0 on success, -1 on failure

Definition at line 26 of file [nlfs\\_file.cpp](#).

#### 16.56.2.3 int NLFS\_File::Read ( void \* pvBuf\_, K\_ULONG ulLen\_ )

Read Read bytes from a file into a specified data buffer.

## Parameters

in	<i>uLen_</i>	- Length (in bytes) of data to read
out	<i>pvBuf_</i>	- Pointer to the buffer to read into

## Returns

Number of bytes read from the file

Definition at line 151 of file [nlfs\\_file.cpp](#).

## 16.56.2.4 int NLFS\_File::Seek ( K\_ULONG uOffset\_ )

Seek Seek to the specified byte offset within the file.

## Parameters

in	<i>uOffset_</i>	Offset in bytes from the beginning of the file
----	-----------------	--

## Returns

0 on success, -1 on failure

Definition at line 112 of file [nlfs\\_file.cpp](#).

## 16.56.2.5 int NLFS\_File::Write ( void \* pvBuf\_, K\_ULONG uLen\_ )

Write Write a specified blob of data to the file.

## Parameters

in	<i>uLen_</i>	- Length (in bytes) of the source buffer
in	<i>pvBuf_</i>	- Pointer to the data buffer containing the data to be written

## Returns

Number of bytes written to the file

Definition at line 217 of file [nlfs\\_file.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/nlfs\\_file.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/nlfs\\_file.cpp](#)

## 16.57 NLFS\_File\_Node\_t Struct Reference

Data structure for the "file" FS-node type.

```
#include <nlfs.h>
```

## Public Attributes

- K\_CHAR [acFileName](#) [16]  
*Arbitrary, 16-char filename.*
- K\_USHORT [usNextPeer](#)

- *Index of the next peer file node.*
- K\_USHORT [usPrevPeer](#)
- *Index of the previous peer node.*
- K\_UCHAR [ucGroup](#)
- *Group ID of the owner.*
- K\_UCHAR [ucUser](#)
- *User ID of the owner.*
- K\_USHORT [usPerms](#)
- *File permissions (POSIX-style)*
- K\_USHORT [usParent](#)
- *Index of the parent file node.*
- K\_USHORT [usChild](#)
- *Index of the first child node.*
- K\_ULONG [ulAllocSize](#)
- *Size of the file (allocated)*
- K\_ULONG [ulFileSize](#)
- *Size of the file (in-bytes)*
- K\_ULONG [ulFirstBlock](#)
- *Index of the first file block.*
- K\_ULONG [ulLastBlock](#)
- *Index of the last file block.*

### 16.57.1 Detailed Description

Data structure for the "file" FS-node type.

Note that this is the same as for a directory node (although fewer fields are used for that case, as documented).

Definition at line 168 of file [nlfs.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/nlfs.h](#)

## 16.58 NLFS\_File\_Stat\_t Struct Reference

Structure used to report the status of a given file.

```
#include <nlfs.h>
```

### Public Attributes

- K\_ULONG [ulAllocSize](#)
- *Size of the file including partial blocks.*
- K\_ULONG [ulFileSize](#)
- *Actual size of the file.*
- K\_USHORT [usPerms](#)
- *Permissions attached to the file.*
- K\_UCHAR [ucUser](#)
- *User associated with this file.*
- K\_UCHAR [ucGroup](#)
- *Group associated with this file.*
- K\_CHAR [acFileName](#) [16]
- *Copy of the file name.*

### 16.58.1 Detailed Description

Structure used to report the status of a given file.

Definition at line 266 of file [nlfs.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/nlfs.h](#)

## 16.59 NLFS\_Host\_t Union Reference

Union used for managing host-specific pointers/data-types.

```
#include <nlfs.h>
```

### Public Attributes

- void \* **pvData**
- uint32\_t **u32Data**
- uint64\_t **u64Data**
- K\_ADDR **kaData**

### 16.59.1 Detailed Description

Union used for managing host-specific pointers/data-types.

This is all pretty abstract, as the data represented here is only accessed by the underlying physical media drive.

Definition at line 253 of file [nlfs.h](#).

The documentation for this union was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/nlfs.h](#)

## 16.60 NLFS\_Node\_t Struct Reference

Filesystem node data structure.

```
#include <nlfs.h>
```

### Public Attributes

- [NLFS\\_Type\\_t](#) **eBlockType**  
*Block type ID.*

### 16.60.1 Detailed Description

Filesystem node data structure.

Contains the block type, as well as the union between the various FS-node data structures. This is also the same data format as how data is stored "on-disk"

Definition at line 215 of file [nlfs.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/nlfs.h](#)

## 16.61 NLFS\_RAM Class Reference

The [NLFS\\_RAM](#) class.

```
#include <nlfs_ram.h>
```

Inheritance diagram for NLFS\_RAM:

### Private Member Functions

- virtual void [Read\\_Node](#) (K\_USHORT usNode\_, [NLFS\\_Node\\_t](#) \*pstNode\_)  
*Read\_Node is an implementation-specific method used to read a file node from physical storage into a local data struture.*
- virtual void [Write\\_Node](#) (K\_USHORT usNode\_, [NLFS\\_Node\\_t](#) \*pstNode\_)  
*Write\_Node is an implementation-specific method used to write a file node from a local structure back to the physical storage.*
- virtual void [Read\\_Block\\_Header](#) (K\_ULONG ulBlock\_, [NLFS\\_Block\\_t](#) \*pstBlock\_)  
*Read\_Block\_Header is an implementation-specific method used to read a file block header from physical storage into a local struct.*
- virtual void [Write\\_Block\\_Header](#) (K\_ULONG ulBlock\_, [NLFS\\_Block\\_t](#) \*pstFileBlock\_)  
*Write\_Block\_Header is an implementation-specific method used to write a file block header back to physical storage from a local struct.*
- virtual void [Read\\_Block](#) (K\_ULONG ulBlock\_, K\_ULONG ulOffset\_, void \*pvData\_, K\_ULONG ulLen\_)  
*Read\_Block is an implementation-specific method used to read raw file data from physical storage into a local buffer.*
- void [Write\\_Block](#) (K\_ULONG ulBlock\_, K\_ULONG ulOffset\_, void \*pvData\_, K\_ULONG ulLen\_)  
*Write\_Block is an implementation-specific method used to write a piece of file data to its data block in the underlying physical storage.*

### Additional Inherited Members

#### 16.61.1 Detailed Description

The [NLFS\\_RAM](#) class.

This class implements an [NLFS](#) filesystem in a RAM buffer. In this case, the host pointer passed into the "format" call is a pointer to the locally- allocated buffer in which the filesystem lives.

Definition at line 31 of file [nlfs\\_ram.h](#).

## 16.61.2 Member Function Documentation

16.61.2.1 void NLFS\_RAM::Read\_Block ( K\_ULONG *ulBlock\_*, K\_ULONG *ulOffset\_*, void \* *pvData\_*, K\_ULONG *ulLen\_* )  
[private], [virtual]

Read\_Block is an implementation-specific method used to read raw file data from physical storage into a local buffer.

**Parameters**

in	<i>ulBlock_</i>	- filesystem block ID corresponding to the file
in	<i>ulOffset_</i>	- offset (in bytes) from the beginning of the block
out	<i>pvData_</i>	- output buffer to read into
in	<i>ulLen_</i>	- length of data to read (in bytes)

Implements [NLFS](#).

Definition at line 63 of file [nlfs\\_ram.cpp](#).

```
16.61.2.2 void NLFS_RAM::Read_Block_Header ( K_ULONG ulBlock_, NLFS_Block_t* pstBlock_ ) [private],
          [virtual]
```

Read\_Block\_Header is an implementation-specific method used to read a file block header from physical storage into a local struct.

**Parameters**

in	<i>ulBlock_</i>	- data block index
out	<i>pstBlock_</i>	- block header structure to read into

Implements [NLFS](#).

Definition at line 43 of file [nlfs\\_ram.cpp](#).

```
16.61.2.3 void NLFS_RAM::Read_Node ( K_USHORT usNode_, NLFS_Node_t* pstNode_ ) [private],
          [virtual]
```

Read\_Node is an implementation-specific method used to read a file node from physical storage into a local data structure.

**Parameters**

in	<i>usNode_</i>	- File node index
out	<i>pstNode_</i>	- Pointer to the file node object to read into

Implements [NLFS](#).

Definition at line 25 of file [nlfs\\_ram.cpp](#).

```
16.61.2.4 void NLFS_RAM::Write_Block ( K_ULONG ulBlock_, K_ULONG ulOffset_, void* pvData_, K_ULONG ulLen_ )
          [private], [virtual]
```

Write\_Block is an implementation-specific method used to write a piece of file data to its data block in the underlying physical storage.

**Parameters**

in	<i>ulBlock_</i>	- filesystem block ID corresponding to the file
in	<i>ulOffset_</i>	- offset (in bytes) from the beginning of the block
in	<i>pvData_</i>	- data buffer to write to disk
in	<i>ulLen_</i>	- length of data to write (in bytes)

Implements [NLFS](#).

Definition at line 73 of file [nlfs\\_ram.cpp](#).

```
16.61.2.5 void NLFS_RAM::Write_Block_Header ( K_ULONG ulBlock_, NLFS_Block_t* pstFileBlock_ ) [private],  
[virtual]
```

Write\_Block\_Header is an implementation-specific method used to write a file block header back to physical storage from a local struct.

**Parameters**

in	<i>ulBlock_</i>	- data block index
in	<i>pstFileBlock_</i>	- pointer to the local data structure to write from

Implements [NLFS](#).

Definition at line 53 of file [nlfs\\_ram.cpp](#).

```
16.61.2.6 void NLFS_RAM::Write_Node ( K_USHORT usNode_, NLFS_Node_t * pstNode_ ) [private],
          [virtual]
```

Write\_Node is an implementation-specific method used to write a file node from a local structure back to the physical storage.

**Parameters**

in	<i>usNode_</i>	- File node index
in	<i>pstNode_</i>	- Pointer to the file node object to write from

Implements [NLFS](#).

Definition at line 34 of file [nlfs\\_ram.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/nlfs\\_ram.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/nlfs\\_ram.cpp](#)

## 16.62 NLFS\_Root\_Node\_t Struct Reference

Data structure for the Root-configuration FS-node type.

```
#include <nlfs.h>
```

**Public Attributes**

- K\_USHORT [usNumFiles](#)  
*Number of file nodes in the FS.*
- K\_USHORT [usNumFilesFree](#)  
*Number of free file nodes.*
- K\_USHORT [usNextFreeNode](#)  
*Index of the next free file.*
- K\_ULONG [ulNumBlocks](#)  
*Number of blocks in the FS.*
- K\_ULONG [ulNumBlocksFree](#)  
*Number of free blocks.*
- K\_ULONG [ulNextFreeBlock](#)  
*Index of the next free block.*
- K\_ULONG [ulBlockSize](#)  
*Size of each block on disk.*
- K\_ULONG [ulBlockOffset](#)  
*Byte-offset to the first block struct.*
- K\_ULONG [ulDataOffset](#)  
*Byte-offset to the first data block.*

### 16.62.1 Detailed Description

Data structure for the Root-configuration FS-node type.

Definition at line 194 of file [nlfs.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/nlfs.h](#)

## 16.63 NotificationControl Class Reference

Inheritance diagram for NotificationControl:

### Public Member Functions

- virtual void [Init](#) ()  
*Initialize the control - must be called before use.*
- virtual void [Draw](#) ()  
*Redraw the control "cleanly".*
- virtual [GuiReturn\\_t](#) [ProcessEvent](#) ([GuiEvent\\_t](#) \*pstEvent\_)  
*Process an event sent to the control.*
- virtual void [Activate](#) (bool bActivate\_)  
*Activate or deactivate the current control - used when switching from one active control to another.*
- void [SetFont](#) ([Font\\_t](#) \*pstFont\_)
- void [SetCaption](#) (const K\_CHAR \*szCaption\_)
- void [Trigger](#) (K\_USHORT usTimeout\_)

### Private Attributes

- const K\_CHAR \* [m\\_szCaption](#)
- [Font\\_t](#) \* [m\\_pstFont](#)
- K\_USHORT [m\\_usTimeout](#)
- bool [m\\_bTrigger](#)
- bool [m\\_bVisible](#)

### Additional Inherited Members

#### 16.63.1 Detailed Description

Definition at line 29 of file [control\\_notification.h](#).

## 16.63.2 Member Function Documentation

16.63.2.1 `virtual void NotificationControl::Activate ( bool bActivate_ ) [inline], [virtual]`

Activate or deactivate the current control - used when switching from one active control to another.

## Parameters

<i>bActivate_</i>	- true to activate, false to deactivate
-------------------	---

Implements [GuiControl](#).

Definition at line 43 of file [control\\_notification.h](#).

#### 16.63.2.2 void NotificationControl::Draw ( ) [virtual]

Redraw the control "cleanly".

Subclass specific.

Implements [GuiControl](#).

Definition at line 26 of file [control\\_notification.cpp](#).

#### 16.63.2.3 virtual void NotificationControl::Init ( ) [inline],[virtual]

Initialize the control - must be called before use.

Implementation is subclass specific.

Implements [GuiControl](#).

Definition at line 32 of file [control\\_notification.h](#).

#### 16.63.2.4 GuiReturn\_t NotificationControl::ProcessEvent ( GuiEvent\_t \* pstEvent\_ ) [virtual]

Process an event sent to the control.

Subclass specific implementation.

## Parameters

<i>pstEvent_</i>	Pointer to a struct containing the event data
------------------	---

Implements [GuiControl](#).

Definition at line 92 of file [control\\_notification.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/control\\_notification.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/control\\_notification.cpp](#)

## 16.64 Option\_t Struct Reference

Structure used to represent a command-line option with its arguments.

```
#include <shell_support.h>
```

### Public Attributes

- [Token\\_t](#) \* [pstStart](#)  
*Pointer to the beginning of a token array contain the option and its arguments.*
- [K\\_UCHAR](#) [ucCount](#)  
*Number of tokens in the token array.*

### 16.64.1 Detailed Description

Structure used to represent a command-line option with its arguments.

An option is defined as any token beginning with a "-" value. The tokens arguments are subsequent tokens that do not begin with "-".

Where no "-" values are specified, each token becomes its own option.

i.e. given the following command-line

```
mycmd -opt1 a b c -opt2 d e f -opt 3
```

The possible `Option_t` structures would be:

```
pstStart => Array containing tokens for -opt1, a, b, c
ucCount  => 4 (4 tokens, including the option token, "-opt1")

pstStart => Array containing tokens for -opt2, d, e, f
ucCount  => 4 (4 tokens, including the option token, "-opt2")

pstStart => Array containing tokens for -opt, 3
ucCount  => 2 (2 tokens, including the option token, "-opt3")
```

in the case of:

```
mycmd a b c
```

Possible token values would be:

```
pstStart => Array containing tokens for a
ucCount  => 1

pstStart => Array containing tokens for b
ucCount  => 1

pstStart => Array containing tokens for c
ucCount  => 1
```

Definition at line 83 of file [shell\\_support.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/shell\\_support.h](#)

## 16.65 PanelControl Class Reference

Inheritance diagram for PanelControl:

### Public Member Functions

- virtual void [Init](#) ()

- Initialize the control - must be called before use.*
- virtual void [Draw](#) ()  
*Redraw the control "cleanly".*
- virtual [GuiReturn\\_t ProcessEvent](#) ([GuiEvent\\_t](#) \*pstEvent\_)  
*Process an event sent to the control.*
- virtual void [Activate](#) (bool bActivate\_)  
*Activate or deactivate the current control - used when switching from one active control to another.*
- void [SetColor](#) (COLOR eColor\_)

### Private Attributes

- COLOR [m\\_uColor](#)

### Additional Inherited Members

#### 16.65.1 Detailed Description

Definition at line 33 of file [control\\_panel.h](#).

#### 16.65.2 Member Function Documentation

16.65.2.1 virtual void [PanelControl::Activate](#) ( bool *bActivate\_* ) [inline],[virtual]

Activate or deactivate the current control - used when switching from one active control to another.

Parameters

<i>bActivate_</i>	- true to activate, false to deactivate
-------------------	---

Implements [GuiControl](#).

Definition at line 39 of file [control\\_panel.h](#).

16.65.2.2 void [PanelControl::Draw](#) ( ) [virtual]

Redraw the control "cleanly".

Subclass specific.

Implements [GuiControl](#).

Definition at line 26 of file [control\\_panel.cpp](#).

16.65.2.3 virtual void [PanelControl::Init](#) ( ) [inline],[virtual]

Initialize the control - must be called before use.

Implementation is subclass specific.

Implements [GuiControl](#).

Definition at line 36 of file [control\\_panel.h](#).

16.65.2.4 virtual [GuiReturn\\_t PanelControl::ProcessEvent](#) ( [GuiEvent\\_t](#) \* *pstEvent\_* ) [inline],[virtual]

Process an event sent to the control.

Subclass specific implementation.

## Parameters

<code>pstEvent_</code>	Pointer to a struct containing the event data
------------------------	---

Implements [GuiControl](#).

Definition at line 38 of file [control\\_panel.h](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/control\\_panel.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/control\\_panel.cpp](#)

## 16.66 Profiler Class Reference

System profiling timer interface.

```
#include <kprofile.h>
```

### Static Public Member Functions

- static void [Init](#) ()  
*Initialize the global system profiler.*
- static void [Start](#) ()  
*Start the global profiling timer service.*
- static void [Stop](#) ()  
*Stop the global profiling timer service.*
- static K\_USHORT [Read](#) ()  
*Read the current tick count in the timer.*
- static void [Process](#) ()  
*Process the profiling counters from ISR.*
- static K\_ULONG [GetEpoch](#) ()  
*Return the current timer epoch.*

### Static Private Attributes

- static K\_ULONG **m\_ulEpoch**

### 16.66.1 Detailed Description

System profiling timer interface.

Definition at line 37 of file [kprofile.h](#).

### 16.66.2 Member Function Documentation

#### 16.66.2.1 void Profiler::Init ( void ) [static]

Initialize the global system profiler.

Must be called prior to use.

Definition at line 32 of file [kprofile.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/kprofile.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/kprofile.cpp](#)

## 16.67 ProfileTimer Class Reference

Profiling timer.

```
#include <profile.h>
```

### Public Member Functions

- void [Init](#) ()  
*Initialize the profiling timer prior to use.*
- void [Start](#) ()  
*Start a profiling session, if the timer is not already active.*
- void [Stop](#) ()  
*Stop the current profiling session, adding to the cumulative time for this timer, and the total iteration count.*
- K\_ULONG [GetAverage](#) ()  
*Get the average time associated with this operation.*
- K\_ULONG [GetCurrent](#) ()  
*Return the current tick count held by the profiler.*

### Private Member Functions

- K\_ULONG [ComputeCurrentTicks](#) (K\_USHORT usCount\_, K\_ULONG ulEpoch\_)  
*Figure out how many ticks have elapsed in this iteration.*

### Private Attributes

- K\_ULONG [m\\_ulCumulative](#)  
*Cumulative tick-count for this timer.*
- K\_ULONG [m\\_ulCurrentIteration](#)  
*Tick-count for the current iteration.*
- K\_USHORT [m\\_usInitial](#)  
*Initial count.*
- K\_ULONG [m\\_ulInitialEpoch](#)  
*Initial Epoch.*
- K\_USHORT [m\\_usIterations](#)  
*Number of iterations executed for this profiling timer.*
- K\_UCHAR [m\\_bActive](#)  
*Whether or not the timer is active or stopped.*

### 16.67.1 Detailed Description

Profiling timer.

This class is used to perform high-performance profiling of code to see how K\_LONG certain operations take. Useful in instrumenting the performance of key algorithms and time-critical operations to ensure real-timer behavior.

Definition at line 69 of file [profile.h](#).

## 16.67.2 Member Function Documentation

16.67.2.1 K\_ULONG ProfileTimer::ComputeCurrentTicks ( K\_USHORT *usCount\_*, K\_ULONG *ulEpoch\_* ) [private]

Figure out how many ticks have elapsed in this iteration.

## Parameters

<i>usCount_</i>	Current timer count
<i>ulEpoch_</i>	Current timer epoch

## Returns

Current tick count

Definition at line 106 of file [profile.cpp](#).

## 16.67.2.2 K\_ULONG ProfileTimer::GetAverage ( )

Get the average time associated with this operation.

## Returns

Average tick count normalized over all iterations

Definition at line 79 of file [profile.cpp](#).

## 16.67.2.3 K\_ULONG ProfileTimer::GetCurrent ( )

Return the current tick count held by the profiler.

Valid for both active and stopped timers.

## Returns

The currently held tick count.

Definition at line 89 of file [profile.cpp](#).

## 16.67.2.4 void ProfileTimer::Init ( void )

Initialize the profiling timer prior to use.

Can also be used to reset a timer that's been used previously.

Definition at line 37 of file [profile.cpp](#).

## 16.67.2.5 void ProfileTimer::Start ( void )

Start a profiling session, if the timer is not already active.

Has no effect if the timer is already active.

Definition at line 46 of file [profile.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/profile.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/profile.cpp](#)

## 16.68 ProgressControl Class Reference

Inheritance diagram for ProgressControl:

## Public Member Functions

- virtual void [Init](#) ()  
*Initialize the control - must be called before use.*
- virtual void [Draw](#) ()  
*Redraw the control "cleanly".*
- virtual [GuiReturn\\_t](#) [ProcessEvent](#) ([GuiEvent\\_t](#) \*pstEvent\_)  
*Process an event sent to the control.*
- virtual void [Activate](#) (bool bActivate\_)  
*Activate or deactivate the current control - used when switching from one active control to another.*
- void [SetBackColor](#) (COLOR eColor\_)
- void [SetProgressColor](#) (COLOR eColor\_)
- void [SetBorderColor](#) (COLOR eColor\_)
- void [SetProgress](#) (K\_UCHAR ucProgress\_)

## Private Attributes

- COLOR [m\\_uBackColor](#)
- COLOR [m\\_uProgressColor](#)
- COLOR [m\\_uBorderColor](#)
- K\_UCHAR [m\\_ucProgress](#)

## Additional Inherited Members

### 16.68.1 Detailed Description

Definition at line 30 of file [control\\_progress.h](#).

### 16.68.2 Member Function Documentation

16.68.2.1 virtual void [ProgressControl::Activate](#) ( bool *bActivate\_* ) [inline], [virtual]

Activate or deactivate the current control - used when switching from one active control to another.

Parameters

<i>bActivate_</i>	- true to activate, false to deactivate
-------------------	---

Implements [GuiControl](#).

Definition at line 36 of file [control\\_progress.h](#).

**16.68.2.2** void ProgressControl::Draw ( ) [virtual]

Redraw the control "cleanly".

Subclass specific.

Implements [GuiControl](#).

Definition at line 36 of file [control\\_progress.cpp](#).

**16.68.2.3** void ProgressControl::Init ( ) [virtual]

Initialiize the control - must be called before use.

Implementation is subclass specific.

Implements [GuiControl](#).

Definition at line 27 of file [control\\_progress.cpp](#).

**16.68.2.4** GuiReturn\_t ProgressControl::ProcessEvent ( GuiEvent\_t \* *pstEvent\_* ) [virtual]

Process an event sent to the control.

Subclass specific implementation.

Parameters

<i>pstEvent_</i>	Pointer to a struct containing the event data
------------------	---

Implements [GuiControl](#).

Definition at line 102 of file [control\\_progress.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/control\\_progress.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/control\\_progress.cpp](#)

## 16.69 PseudoRandom Class Reference

The [PseudoRandom](#) class.

```
#include <rand_lfsr.h>
```

### Public Member Functions

- [PseudoRandom](#) ()  
*PseudoRandom.*
- void [Seed](#) (K\_ULONG ulSeed1\_, K\_ULONG ulSeed2\_)  
*Seed.*
- K\_USHORT [GetRandom](#) ()  
*GetRandom.*

### Private Member Functions

- K\_ULONG [Shift](#) (K\_ULONG \*pulFSR\_, K\_ULONG ulMask\_)  
*Shift.*

## Private Attributes

- K\_ULONG m\_ulFSR1
- K\_ULONG m\_ulFSR2

### 16.69.1 Detailed Description

The [PseudoRandom](#) class.

Pseudro-Random Number Generator based on a 32-bit linear-feedback shift register. For reference, the implementation is based on the Maxim IC application note "AN4000"

<http://www.maximintegrated.com/app-notes/index.mvp/id/4400>

Definition at line 37 of file [rand\\_lfsr.h](#).

### 16.69.2 Constructor & Destructor Documentation

#### 16.69.2.1 PseudoRandom::PseudoRandom ( )

[PseudoRandom](#).

Default constructor

Definition at line 26 of file [rand\\_lfsr.cpp](#).

### 16.69.3 Member Function Documentation

#### 16.69.3.1 K\_USHORT PseudoRandom::GetRandom ( )

GetRandom.

Return a 16-bit random number.

Returns

16-bit random number

Definition at line 40 of file [rand\\_lfsr.cpp](#).

#### 16.69.3.2 void PseudoRandom::Seed ( K\_ULONG ulSeed1\_, K\_ULONG ulSeed2\_ )

Seed.

Initialize the LFSR registers in the object, seeding the random number generator.

Parameters

<i>ulSeed1_</i>	Seed value for LFSR register 1
<i>ulSeed2_</i>	Seed value for LFSR register 2

Definition at line 33 of file [rand\\_lfsr.cpp](#).

#### 16.69.3.3 K\_ULONG PseudoRandom::Shift ( K\_ULONG \* pulFSR\_, K\_ULONG ulMask\_ ) [private]

Shift.

Deep magic to drive the the LFSR state machine

## Parameters

<i>pullFSR_</i>	Pointer to the register to drive
<i>ulMask_</i>	Bitmask to apply as an XOR

## Returns

new value in the LFSR register

Definition at line 48 of file [rand\\_lfsr.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/rand\\_lfsr.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/rand\\_lfsr.cpp](#)

## 16.70 Quantum Class Reference

Static-class used to implement [Thread](#) quantum functionality, which is a key part of round-robin scheduling.

```
#include <quantum.h>
```

### Static Public Member Functions

- static void [UpdateTimer](#) ()  
*This function is called to update the thread quantum timer whenever something in the scheduler has changed.*
- static void [AddThread](#) ([Thread](#) \*pclThread\_)  
*Add the thread to the quantum timer.*
- static void [RemoveThread](#) ()  
*Remove the thread from the quantum timer.*
- static void [SetInTimer](#) (void)  
*SetInTimer.*
- static void [ClearInTimer](#) (void)  
*ClearInTimer.*

### Static Private Member Functions

- static void [SetTimer](#) ([Thread](#) \*pclThread\_)  
*Set up the quantum timer in the timer scheduler.*

### Static Private Attributes

- static [Timer](#) **m\_clQuantumTimer**
- static K\_UCHAR **m\_bActive**
- static K\_UCHAR **m\_bInTimer**

#### 16.70.1 Detailed Description

Static-class used to implement [Thread](#) quantum functionality, which is a key part of round-robin scheduling.

Definition at line 39 of file [quantum.h](#).

## 16.70.2 Member Function Documentation

### 16.70.2.1 void Quantum::AddThread ( Thread \* *pciThread\_* ) [static]

Add the thread to the quantum timer.

Only one thread can own the quantum, since only one thread can be running on a core at a time.

Definition at line 71 of file [quantum.cpp](#).

### 16.70.2.2 static void Quantum::ClearInTimer ( void ) [inline],[static]

ClearInTimer.

Clear the flag once the timer callback function has been completed.

Definition at line 82 of file [quantum.h](#).

### 16.70.2.3 void Quantum::RemoveThread ( void ) [static]

Remove the thread from the quantum timer.

This will cancel the timer.

Definition at line 97 of file [quantum.cpp](#).

### 16.70.2.4 static void Quantum::SetInTimer ( void ) [inline],[static]

SetInTimer.

Set a flag to indicate that the CPU is currently running within the timer-callback routine. This prevents the [Quantum](#) timer from being updated in the middle of a callback cycle, potentially resulting in the kernel timer becoming disabled.

Definition at line 75 of file [quantum.h](#).

### 16.70.2.5 void Quantum::SetTimer ( Thread \* *pciThread\_* ) [static],[private]

Set up the quantum timer in the timer scheduler.

This creates a one-shot timer, which calls a static callback in [quantum.cpp](#) that on expiry will pivot the head of the threadlist for the thread's priority. This is the mechanism that provides round-robin scheduling in the system.

Parameters

<i>pciThread_</i>	Pointer to the thread to set the <a href="#">Quantum</a> timer on
-------------------	---

Definition at line 61 of file [quantum.cpp](#).

### 16.70.2.6 void Quantum::UpdateTimer ( void ) [static]

This function is called to update the thread quantum timer whenever something in the scheduler has changed.

This can result in the timer being re-loaded or started. The timer is never stopped, but it may be ignored on expiry.

Definition at line 110 of file [quantum.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/quantum.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/quantum.cpp](#)

## 16.71 Scheduler Class Reference

Priority-based round-robin [Thread](#) scheduling, using ThreadLists for housekeeping.

```
#include <scheduler.h>
```

### Static Public Member Functions

- static void [Init](#) ()  
*Intialize the scheduler, must be called before use.*
- static void [Schedule](#) ()  
*Run the scheduler, determines the next thread to run based on the current state of the threads.*
- static void [Add](#) ([Thread](#) \*pciThread\_)  
*Add a thread to the scheduler at its current priority level.*
- static void [Remove](#) ([Thread](#) \*pciThread\_)  
*Remove a thread from the scheduler at its current priority level.*
- static K\_BOOL [SetScheduler](#) (K\_BOOL bEnable\_)  
*Set the active state of the scheduler.*
- static [Thread](#) \* [GetCurrentThread](#) ()  
*Return the pointer to the currently-running thread.*
- static [Thread](#) \* [GetNextThread](#) ()  
*Return the pointer to the thread that should run next, according to the last run of the scheduler.*
- static [ThreadList](#) \* [GetThreadList](#) (K\_UCHAR ucPriority\_)  
*Return the pointer to the active list of threads that are at the given priority level in the scheduler.*
- static [ThreadList](#) \* [GetStopList](#) ()  
*Return the pointer to the list of threads that are in the scheduler's stopped state.*
- static K\_UCHAR [IsEnabled](#) ()  
*Return the current state of the scheduler - whether or not scheudling is enabled or disabled.*
- static void [QueueScheduler](#) ()

### Static Private Attributes

- static K\_BOOL [m\\_bEnabled](#)  
*Scheduler's state - enabled or disabled.*
- static K\_BOOL [m\\_bQueuedSchedule](#)  
*Variable representing whether or not there's a queued scheduler operation.*
- static [ThreadList](#) [m\\_clStopList](#)  
*ThreadList for all stopped threads.*
- static [ThreadList](#) [m\\_aclPriorities](#) [NUM\_PRIORITIES]  
*ThreadLists for all threads at all priorities.*
- static K\_UCHAR [m\\_ucPriFlag](#)  
*Bitmap flag for each.*

#### 16.71.1 Detailed Description

Priority-based round-robin [Thread](#) scheduling, using ThreadLists for housekeeping.

Definition at line 62 of file [scheduler.h](#).

## 16.71.2 Member Function Documentation

16.71.2.1 `void Scheduler::Add ( Thread * pclThread_ ) [static]`

Add a thread to the scheduler at its current priority level.

## Parameters

<i>pcThread_</i>	Pointer to the thread to add to the scheduler
------------------	---

Definition at line 81 of file [scheduler.cpp](#).

#### 16.71.2.2 static Thread\* Scheduler::GetCurrentThread ( ) [inline],[static]

Return the pointer to the currently-running thread.

## Returns

Pointer to the currently-running thread

Definition at line 119 of file [scheduler.h](#).

#### 16.71.2.3 static Thread\* Scheduler::GetNextThread ( ) [inline],[static]

Return the pointer to the thread that should run next, according to the last run of the scheduler.

## Returns

Pointer to the next-running thread

Definition at line 127 of file [scheduler.h](#).

#### 16.71.2.4 static ThreadList\* Scheduler::GetStopList ( ) [inline],[static]

Return the pointer to the list of threads that are in the scheduler's stopped state.

## Returns

Pointer to the [ThreadList](#) containing the stopped threads

Definition at line 145 of file [scheduler.h](#).

#### 16.71.2.5 static ThreadList\* Scheduler::GetThreadList ( K\_UCHAR ucPriority\_ ) [inline],[static]

Return the pointer to the active list of threads that are at the given priority level in the scheduler.

## Parameters

<i>ucPriority_</i>	Priority level of
--------------------	-------------------

## Returns

Pointer to the [ThreadList](#) for the given priority level

Definition at line 137 of file [scheduler.h](#).

#### 16.71.2.6 K\_UCHAR Scheduler::IsEnabled ( ) [inline],[static]

Return the current state of the scheduler - whether or not scheduling is enabled or disabled.

## Returns

true - scheduler enabled, false - disabled

Definition at line 155 of file [scheduler.h](#).

16.71.2.7 `void Scheduler::Remove ( Thread * pcThread_ ) [static]`

Remove a thread from the scheduler at its current priority level.

## Parameters

<code>pcThread_</code>	Pointer to the thread to be removed from the scheduler
------------------------	--

Definition at line 88 of file [scheduler.cpp](#).

## 16.71.2.8 Scheduler::Schedule ( ) [static]

Run the scheduler, determines the next thread to run based on the current state of the threads.

Note that the next-thread chosen from this function is only valid while in a critical section.

Definition at line 64 of file [scheduler.cpp](#).

## 16.71.2.9 void Scheduler::SetScheduler ( K\_BOOL bEnable\_ ) [static]

Set the active state of the scheduler.

When the scheduler is disabled, the *next thread* is never set; the currently running thread will run forever until the scheduler is enabled again. Care must be taken to ensure that we don't end up trying to block while the scheduler is disabled, otherwise the system ends up in an unusable state.

## Parameters

<code>bEnable_</code>	true to enable, false to disable the scheduler
-----------------------	--

Definition at line 95 of file [scheduler.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/scheduler.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/scheduler.cpp](#)

## 16.72 Screen Class Reference

Inheritance diagram for Screen:

## Public Member Functions

- void [Activate](#) ()  
*This is called when a new screen needs to be created.*
- void [Deactivate](#) ()  
*This is called when a screen is torn-down.*
- void [SetWindowAffinity](#) (const K\_CHAR \*szWindowName\_)  
*Indicate by name which window this screen is to be bound.*
- void [SetName](#) (const K\_CHAR \*szName\_)  
*Set the name of the current screen.*
- const K\_CHAR \* [GetName](#) ()  
*Return the name of the current screen.*

## Protected Member Functions

- void [SetManager](#) ([ScreenManager](#) \*pclScreenManager\_)  
Function called by the [ScreenManager](#) to set the screen affinity.

## Protected Attributes

- const K\_CHAR \* **m\_szName**
- [ScreenManager](#) \* **m\_pclScreenManager**
- [GuiWindow](#) \* **m\_pclWindow**

## Private Member Functions

- virtual void **Create** ()=0
- virtual void **Destroy** ()=0

## Friends

- class **ScreenManager**

### 16.72.1 Detailed Description

Definition at line 31 of file [screen.h](#).

### 16.72.2 Member Function Documentation

#### 16.72.2.1 void Screen::Activate ( ) [inline]

This is called when a new screen needs to be created.

This calls the underlying virtual "create" method, which performs all control object initialization and allocation. Calling a redraw(true) on the bound window will result in the new window being rendered to display.

Definition at line 40 of file [screen.h](#).

#### 16.72.2.2 void Screen::Deactivate ( ) [inline]

This is called when a screen is torn-down.

Essentially removes the controls from the named window and deallocates any memory used to build up the screen.

Definition at line 47 of file [screen.h](#).

The documentation for this class was generated from the following files:

- /home/moslevin/mark3-source/embedded/stage/src/[screen.h](#)
- /home/moslevin/mark3-source/embedded/stage/src/[screen.cpp](#)

## 16.73 ScreenList Class Reference

### Public Member Functions

- void [Add](#) ([Screen](#) \*pclScreen\_)

- *Add a screen to the screen list.*
- void [Remove](#) ([Screen](#) \*pclScreen\_)
- *Remove a screen from the screen list.*
- [Screen](#) \* [GetHead](#) ()
- *Get the beginning of the screen list.*

### Private Attributes

- [DoubleLinkedList](#) [m\\_clList](#)
- *Double link-list used to manage screen objects.*

#### 16.73.1 Detailed Description

Definition at line 84 of file [screen.h](#).

The documentation for this class was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/screen.h](#)

## 16.74 ScreenManager Class Reference

### Public Member Functions

- void [AddScreen](#) ([Screen](#) \*pclScreen\_)
- *Add a new screen to the screen manager.*
- void [RemoveScreen](#) ([Screen](#) \*pclScreen\_)
- *Remove an existing screen from the screen manager.*
- void [SetEventSurface](#) ([GuiEventSurface](#) \*pclSurface\_)
- *Set the event surface on which this screen manager's screens will be displayed.*
- [GuiWindow](#) \* [FindWindowByName](#) (const K\_CHAR \*m\_szName\_)
- *Return a pointer to a window by name.*
- [Screen](#) \* [FindScreenByName](#) (const K\_CHAR \*m\_szName\_)
- *Return a pointer to a screen by name.*

### Private Attributes

- [ScreenList](#) [m\\_clScreenList](#)
- *[Screen](#) list object used to manage individual screens.*
- [GuiEventSurface](#) \* [m\\_pclSurface](#)
- *Pointer to the GUI Event Surface on which the screens are displayed.*

#### 16.74.1 Detailed Description

Definition at line 109 of file [screen.h](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/screen.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/screen.cpp](#)

## 16.75 Semaphore Class Reference

Counting semaphore, based on [BlockingObject](#) base class.

```
#include <ksemaphore.h>
```

Inheritance diagram for Semaphore:

### Public Member Functions

- void [Init](#) (K\_USHORT usInitVal\_, K\_USHORT usMaxVal\_)  
*Initialize a semaphore before use.*
- void [Post](#) ()  
*Increment the semaphore count.*
- void [Pend](#) ()  
*Decrement the semaphore count.*
- K\_USHORT [GetCount](#) ()  
*Return the current semaphore counter.*
- bool [Pend](#) (K\_ULONG ulWaitTimeMS\_)  
*Decrement the semaphore count.*
- void [Timeout](#) (Thread \*pclChosenOne\_)  
*Wake a thread blocked on the semaphore.*

### Private Member Functions

- K\_UCHAR [WakeNext](#) ()  
*Wake the next thread waiting on the semaphore.*
- K\_BOOL [ProcessQueue](#) ()  
*ProcessQueue.*
- void [PostTransaction](#) (Transaction \*pclTRX\_, K\_BOOL \*pbReschedule\_)  
*PostTransaction.*
- void [PendTransaction](#) (Transaction \*pclTRX\_, K\_BOOL \*pbReschedule\_)  
*PendTransaction.*
- void [TimeoutTransaction](#) (Transaction \*pclTRX\_, K\_BOOL \*pbReschedule\_)  
*TimeoutTransaction.*

### Private Attributes

- K\_USHORT [m\\_usValue](#)  
*Current value in the semaphore.*
- K\_USHORT [m\\_usMaxValue](#)  
*Maximum value that the semaphore can hold.*

## Additional Inherited Members

### 16.75.1 Detailed Description

Counting semaphore, based on [BlockingObject](#) base class.

Definition at line 39 of file [ksemaphore.h](#).

### 16.75.2 Member Function Documentation

#### 16.75.2.1 K\_USHORT Semaphore::GetCount ( )

Return the current semaphore counter.

This can be used by a thread to bypass blocking on a semaphore - allowing it to do other things until a non-zero count is returned, instead of blocking until the semaphore is posted.

##### Returns

The current semaphore counter value.

Definition at line 283 of file [ksemaphore.cpp](#).

#### 16.75.2.2 void Semaphore::Init ( K\_USHORT *usInitVal\_*, K\_USHORT *usMaxVal\_* )

Initialize a semaphore before use.

Must be called before post/pend operations.

##### Parameters

<i>usInitVal_</i>	Initial value held by the semaphore
<i>usMaxVal_</i>	Maximum value for the semaphore

Definition at line 194 of file [ksemaphore.cpp](#).

#### 16.75.2.3 void Semaphore::Pend ( )

Decrement the semaphore count.

If the count is zero, the thread will block until the semaphore is pended.

Definition at line 232 of file [ksemaphore.cpp](#).

#### 16.75.2.4 bool Semaphore::Pend ( K\_ULONG *ulWaitTimeMS\_* )

Decrement the semaphore count.

If the count is zero, the thread will block until the semaphore is pended. If the specified interval expires before the thread is unblocked, then the status is returned back to the user.

##### Returns

true - semaphore was acquired before the timeout false - timeout occurred before the semaphore was claimed.

Definition at line 237 of file [ksemaphore.cpp](#).

16.75.2.5 void Semaphore::PendTransaction ( Transaction \* *pciTRX\_*, K\_BOOL \* *pbReschedule\_* ) [private]

PendTransaction.

Perform a semaphore "pend" operation, as specified from an object on the transaction queue.

## Parameters

<i>pciTRX_</i>	- Pointer to the transaction object
<i>pbReschedule_</i>	- Pointer to boolean to be set true if rescheduling is required.

Definition at line 130 of file [ksemaphore.cpp](#).

## 16.75.2.6 void Semaphore::Post ( )

Increment the semaphore count.

## Returns

true if the semaphore was posted, false if the count is already maxed out.

Definition at line 206 of file [ksemaphore.cpp](#).

## 16.75.2.7 void Semaphore::PostTransaction ( Transaction \* pciTRX\_, K\_BOOL \* pbReschedule\_ ) [private]

PostTransaction.

Perform a semaphore "post" operation, as specified from an object on the transaction queue.

## Parameters

<i>pciTRX_</i>	- Pointer to the transaction object
<i>pbReschedule_</i>	- Pointer to boolean to be set true if rescheduling is required.

Definition at line 109 of file [ksemaphore.cpp](#).

## 16.75.2.8 K\_BOOL Semaphore::ProcessQueue ( ) [private]

ProcessQueue.

Process all pending actions on the semaphore's transaction queue. This should only be called from within a context where the blocking object's Lock() value has already been called. When ProcessQueue returns, the Lock() value will be reset to 0 - as all pending transactions have been processed.

## Returns

true - A thread scheduling operation must be performed. false - No rescheduling is required.

Definition at line 78 of file [ksemaphore.cpp](#).

## 16.75.2.9 void Semaphore::Timeout ( Thread \* pciChosenOne\_ )

Wake a thread blocked on the semaphore.

This is an internal function used for implementing timed semaphores relying on timer callbacks. Since these do not have access to the private data of the semaphore and its base classes, we have to wrap this as a public method - do not use this for any other purposes.

Definition at line 60 of file [ksemaphore.cpp](#).

## 16.75.2.10 void Semaphore::TimeoutTransaction ( Transaction \* pciTRX\_, K\_BOOL \* pbReschedule\_ ) [private]

TimeoutTransaction.

Perform a semaphore "timeout" operation, as specified from an object on the transaction queue.

## Parameters

<i>pciTRX_</i>	- Pointer to the transaction object
<i>pbReschedule_</i>	- Pointer to boolean to be set true if rescheduling is required.

Definition at line 161 of file [ksemaphore.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/ksemaphore.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/ksemaphore.cpp](#)

## 16.76 ShellCommand\_t Struct Reference

Data structure defining a lookup table correlating a command name to its handler function.

```
#include <shell_support.h>
```

## Public Attributes

- const K\_CHAR \* [szCommand](#)  
*Command name.*
- [fp\\_internal\\_command](#) pfHandler  
*Command handler function.*

### 16.76.1 Detailed Description

Data structure defining a lookup table correlating a command name to its handler function.

Definition at line 117 of file [shell\\_support.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/shell\\_support.h](#)

## 16.77 ShellSupport Class Reference

The [ShellSupport](#) class features utility functions which handle token processing, option/parameter lookup, and functions making it generally trivial to implement a lightweight custom shell.

```
#include <shell_support.h>
```

## Static Public Member Functions

- static K\_CHAR [RunCommand](#) ([CommandLine\\_t](#) \*pstCommand\_, const [ShellCommand\\_t](#) \*pastShellCommands\_)  
*RunCommand* Given a command-line, attempts to run the corresponding shell command based where it exists within the supplied [ShellCommand\\_t](#) array.
- static void [UnescapeToken](#) ([Token\\_t](#) \*pstToken\_, K\_CHAR \*szDest\_)  
*UnescapeToken* Convert a token which has special parsing characters in it to a "flattened" string, where all unescaped double quotes and escaped tab, newline, space, etc.
- static [Option\\_t](#) \* [CheckForOption](#) ([CommandLine\\_t](#) \*pstCommand\_, const K\_CHAR \*szOption\_)  
*CheckForOption* Check to see whether or not a specific option has been set within the commandline arguments.

- static K\_CHAR [TokensToCommandLine](#) (Token\_t \*pastTokens\_, K\_UCHAR ucTokens\_, [CommandLine\\_t](#) \*pstCommand\_)

*TokensToCommandLine* Convert an array of tokens to a commandline object.

### 16.77.1 Detailed Description

The [ShellSupport](#) class features utility functions which handle token processing, option/parameter lookup, and functions making it generally trivial to implement a lightweight custom shell.

Definition at line 129 of file [shell\\_support.h](#).

### 16.77.2 Member Function Documentation

16.77.2.1 [Option\\_t](#) \* [ShellSupport::CheckForOption](#) ( [CommandLine\\_t](#) \* *pstCommand\_*, const K\_CHAR \* *szOption\_* )  
[static]

[CheckForOption](#) Check to see whether or not a specific option has been set within the commandline arguments.

Parameters

<i>pstCommand_</i>	Pointer to the commandline object containing the options
<i>szOption_</i>	0-terminated string corresponding to the command-line option.

Returns

Pointer to the command line option on match, or 0 on failure.

Definition at line 104 of file [shell\\_support.cpp](#).

16.77.2.2 K\_CHAR [ShellSupport::RunCommand](#) ( [CommandLine\\_t](#) \* *pstCommand\_*, const [ShellCommand\\_t](#) \* *pastShellCommands\_* ) [static]

[RunCommand](#) Given a command-line, attempts to run the corresponding shell command based where it exists within the supplied [ShellCommand\\_t](#) array.

Parameters

<i>pstCommand_</i>	Pointer to the command-line to execute
<i>pstCommands_</i>	Pointer to an array of shell commands to execute against

Returns

1 on success, 0 on error (command not found)

Definition at line 28 of file [shell\\_support.cpp](#).

16.77.2.3 K\_CHAR [ShellSupport::TokensToCommandLine](#) ( [Token\\_t](#) \* *pastTokens\_*, K\_UCHAR *ucTokens\_*, [CommandLine\\_t](#) \* *pstCommand\_* ) [static]

[TokensToCommandLine](#) Convert an array of tokens to a commandline object.

This operation is non-destructive to the source token array.

## Parameters

<i>pstTokens_</i>	Pointer to the token array to process
<i>ucTokens_</i>	Number of tokens in the token array
<i>pstCommand_</i>	Pointer to the <a href="#">CommandLine_t</a> object which will represent the shell command and its arguments.

## Returns

Number of options processed

Definition at line 123 of file [shell\\_support.cpp](#).

16.77.2.4 void ShellSupport::UnescapeToken ( Token\_t \* *pstToken\_*, K\_CHAR \* *szDest\_* ) [static]

UnescapeToken Convert a token which has special parsing characters in it to a "flattened" string, where all un-escaped double quotes and escaped tab, newline, space, etc.

characters are converted into their ascii-code equivalents.

## Parameters

<i>pstToken_</i>	Pointer to the source token to convert
<i>szDest_</i>	Pointer to a destination string which will contain the parsed result string

Definition at line 49 of file [shell\\_support.cpp](#).

The documentation for this class was generated from the following files:

- /home/moslevin/mark3-source/embedded/stage/src/[shell\\_support.h](#)
- /home/moslevin/mark3-source/embedded/stage/src/[shell\\_support.cpp](#)

## 16.78 SlickButtonControl Class Reference

Inheritance diagram for SlickButtonControl:

### Public Member Functions

- virtual void [Init](#) ()  
*Initialize the control - must be called before use.*
- virtual void [Draw](#) ()  
*Redraw the control "cleanly".*
- virtual [GuiReturn\\_t](#) [ProcessEvent](#) ([GuiEvent\\_t](#) \*pstEvent\_)  
*Process an event sent to the control.*
- virtual void [Activate](#) (bool bActivate\_)  
*Activate or deactivate the current control - used when switching from one active control to another.*
- void [SetFont](#) ([Font\\_t](#) \*pstFont\_)
- void [SetCaption](#) (const K\_CHAR \*szCaption\_)
- void [SetCallback](#) (ButtonCallback pfCallback\_, void \*pvData\_)

## Private Attributes

- `const K_CHAR * m_szCaption`
- `Font_t * m_pstFont`
- `bool m_bState`
- `K_UCHAR m_ucTimeout`
- `void * m_pvCallbackData`
- `ButtonCallback m_pfCallback`

## Additional Inherited Members

### 16.78.1 Detailed Description

Definition at line 32 of file [control\\_slickbutton.h](#).

### 16.78.2 Member Function Documentation

#### 16.78.2.1 `void SlickButtonControl::Activate ( bool bActivate_ ) [virtual]`

Activate or deactivate the current control - used when switching from one active control to another.

Parameters

<i>bActivate_</i>	- true to activate, false to deactivate
-------------------	---

Implements [GuiControl](#).

Definition at line 286 of file [control\\_slickbutton.cpp](#).

#### 16.78.2.2 `void SlickButtonControl::Draw ( ) [virtual]`

Redraw the control "cleanly".

Subclass specific.

Implements [GuiControl](#).

Definition at line 51 of file [control\\_slickbutton.cpp](#).

#### 16.78.2.3 `void SlickButtonControl::Init ( ) [virtual]`

Initialize the control - must be called before use.

Implementation is subclass specific.

Implements [GuiControl](#).

Definition at line 40 of file [control\\_slickbutton.cpp](#).

#### 16.78.2.4 `GuiReturn_t SlickButtonControl::ProcessEvent ( GuiEvent_t * pstEvent_ ) [virtual]`

Process an event sent to the control.

Subclass specific implementation.

## Parameters

<code>pstEvent_</code>	Pointer to a struct containing the event data
------------------------	---

Implements [GuiControl](#).

Definition at line 164 of file [control\\_slickbutton.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/control\\_slickbutton.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/control\\_slickbutton.cpp](#)

## 16.79 SlickGroupBoxControl Class Reference

Inheritance diagram for SlickGroupBoxControl:

### Public Member Functions

- virtual void [Init](#) ()  
*Initialiize the control - must be called before use.*
- virtual void [Draw](#) ()  
*Redraw the control "cleanly".*
- virtual [GuiReturn\\_t](#) [ProcessEvent](#) ([GuiEvent\\_t](#) \*pstEvent\_)  
*Process an event sent to the control.*
- virtual void [Activate](#) (bool bActivate\_)  
*Activate or deactivate the current control - used when switching from one active control to another.*
- void [SetFont](#) ([Font\\_t](#) \*pstFont\_)
- void [SetCaption](#) (const K\_CHAR \*pcCaption\_)
- void [SetBGColor](#) (COLOR uColor\_)

### Private Attributes

#### 16.79.1 Detailed Description

Definition at line 29 of file [control\\_slickgroupbox.h](#).

## 16.79.2 Member Function Documentation

16.79.2.1 `virtual void SlickGroupBoxControl::Activate ( bool bActivate_ )` `[inline]`, `[virtual]`

Activate or deactivate the current control - used when switching from one active control to another.

## Parameters

<i>bActivate_</i>	- true to activate, false to deactivate
-------------------	---

Implements [GuiControl](#).

Definition at line 35 of file [control\\_slickgroupbox.h](#).

#### 16.79.2.2 void SlickGroupBoxControl::Draw ( ) [virtual]

Redraw the control "cleanly".

Subclass specific.

Implements [GuiControl](#).

Definition at line 31 of file [control\\_slickgroupbox.cpp](#).

#### 16.79.2.3 virtual void SlickGroupBoxControl::Init ( ) [inline],[virtual]

Initialiize the control - must be called before use.

Implementation is subclass specific.

Implements [GuiControl](#).

Definition at line 32 of file [control\\_slickgroupbox.h](#).

#### 16.79.2.4 virtual GuiReturn\_t SlickGroupBoxControl::ProcessEvent ( GuiEvent\_t \* *pstEvent\_* ) [inline],[virtual]

Process an event sent to the control.

Subclass specific implementation.

## Parameters

<i>pstEvent_</i>	Pointer to a struct containing the event data
------------------	---

Implements [GuiControl](#).

Definition at line 34 of file [control\\_slickgroupbox.h](#).

The documentation for this class was generated from the following files:

- /home/moslevin/mark3-source/embedded/stage/src/control\_slickgroupbox.h
- /home/moslevin/mark3-source/embedded/stage/src/control\_slickgroupbox.cpp

## 16.80 SlickProgressControl Class Reference

Inheritance diagram for SlickProgressControl:

## Public Member Functions

- virtual void [Init](#) ()  
*Initialiize the control - must be called before use.*
- virtual void [Draw](#) ()  
*Redraw the control "cleanly".*
- virtual [GuiReturn\\_t ProcessEvent](#) ([GuiEvent\\_t](#) \*pstEvent\_)  
*Process an event sent to the control.*

### 16.80.1 Detailed Description

Definition at line 30 of file [control\\_slickprogress.h](#).

### 16.80.2 Member Function Documentation

**16.80.2.1** virtual void [SlickProgressControl::Activate](#) ( bool *bActivate\_* ) [inline],[virtual]

Activate or deactivate the current control - used when switching from one active control to another.

Parameters

<i>bActivate_</i>	- true to activate, false to deactivate
-------------------	---

Implements [GuiControl](#).

Definition at line 36 of file [control\\_slickprogress.h](#).

**16.80.2.2** void [SlickProgressControl::Draw](#) ( ) [virtual]

Redraw the control "cleanly".

Subclass specific.

Implements [GuiControl](#).

Definition at line 33 of file [control\\_slickprogress.cpp](#).

**16.80.2.3** void [SlickProgressControl::Init](#) ( ) [virtual]

Initialiize the control - must be called before use.

Implementation is subclass specific.

Implements [GuiControl](#).

Definition at line 27 of file [control\\_slickprogress.cpp](#).

#### 16.80.2.4 `GuiReturn_t SlickProgressControl::ProcessEvent ( GuiEvent_t * pstEvent_ ) [virtual]`

Process an event sent to the control.

Subclass specific implementation.

##### Parameters

<code>pstEvent_</code>	Pointer to a struct containing the event data
------------------------	---

Implements [GuiControl](#).

Definition at line 107 of file [control\\_slickprogress.cpp](#).

The documentation for this class was generated from the following files:

## 16.81 Slip Class Reference

Object used to frame communications over an abstract device using the serial-line internet protocol (SLIP).

```
#include <slip.h>
```

### Public Member Functions

- void [SetDriver](#) ([Driver](#) \*pclDriver\_)  
*Set the driver to attach to this object.*
- [Driver](#) \* [GetDriver](#) ()  
*Return the pointer to the driver attached to this object.*
- void [WriteData](#) (K\_UCHAR ucChannel\_, const K\_CHAR \*aucBuf\_, K\_USHORT usLen\_)  
*Write a packet of data in the FunkenSlip format.*
- K\_USHORT [ReadData](#) (K\_UCHAR \*pucChannel\_, K\_CHAR \*aucBuf\_, K\_USHORT usLen\_)  
*Read a packet from a specified device, parse, and copy to a specified output buffer.*
- void [WriteVector](#) (K\_UCHAR ucChannel\_, [SlipDataVector](#) \*astData\_, K\_USHORT usLen\_)  
*Write a single message composed of multiple data-vector fragments.*
- void [SendAck](#) ()  
*Send an acknowledgement character to the host.*
- void [SendNack](#) ()  
*Send a negative-acknowledgement character to the host.*

### Static Public Member Functions

- static K\_USHORT [EncodeByte](#) (K\_UCHAR ucChar\_, K\_UCHAR \*aucBuf\_)  
*Encode a single byte into a stream, returning the size of the encoded value (either 1 or 2 bytes).*
- static K\_USHORT [DecodeByte](#) (K\_UCHAR \*ucChar\_, const K\_UCHAR \*aucBuf\_)  
*Decode a byte from a stream into a specified value.*

### Private Member Functions

- void [WriteByte](#) (K\_UCHAR ucData\_)

## Private Attributes

- [Driver](#) \* `m_pclDriver`

### 16.81.1 Detailed Description

Object used to frame communications over an abstract device using the serial-line internet protocol (SLIP).

Definition at line 70 of file [slip.h](#).

### 16.81.2 Member Function Documentation

16.81.2.1 `K_USHORT Slip::DecodeByte ( K_UCHAR * ucChar_, const K_UCHAR * aucBuf_ )` `[static]`

Decode a byte from a stream into a specified value.

Returns the number of bytes from the source array that were processed, (1 or 2), or 0 if an end-of-packet (192) was encountered.

#### Parameters

<i>ucChar_</i>	Destination K_CHAR
<i>aucBuf_</i>	Source buffer

#### Returns

# bytes read, or 0 on terminating character (192)

Definition at line 56 of file [slip.cpp](#).

16.81.2.2 `K_USHORT Slip::EncodeByte ( K_UCHAR ucChar_, K_UCHAR * aucBuf_ )` `[static]`

Encode a single byte into a stream, returning the size of the encoded value (either 1 or 2 bytes).

#### Parameters

<i>ucChar_</i>	Character to encode
<i>aucBuf_</i>	Buffer to encode into

#### Returns

# bytes read

Definition at line 34 of file [slip.cpp](#).

16.81.2.3 `Driver* Slip::GetDriver ( )` `[inline]`

Return the pointer to the driver attached to this object.

#### Returns

Pointer to the driver attached

Definition at line 85 of file [slip.h](#).

16.81.2.4 `K_USHORT Slip::ReadData ( K_UCHAR * pucChannel_, K_CHAR * aucBuf_, K_USHORT usLen_ )`

Read a packet from a specified device, parse, and copy to a specified output buffer.

## Parameters

<i>pucChannel_</i>	Pointer to a uchar that stores the message channel
<i>aucBuf_</i>	Buffer where the message will be decoded
<i>usLen_</i>	Length of the buffer to decode

## Returns

data bytes read, 0 on failure.

Definition at line 104 of file [slip.cpp](#).

16.81.2.5 void Slip::SetDriver ( Driver \* *pclDriver\_* ) [inline]

Set the driver to attach to this object.

## Parameters

<i>pclDriver_</i>	Pointer to the driver to attach
-------------------	---------------------------------

Definition at line 78 of file [slip.h](#).

16.81.2.6 void Slip::WriteData ( K\_UCHAR *ucChannel\_*, const K\_CHAR \* *aucBuf\_*, K\_USHORT *usLen\_* )

Write a packet of data in the FunkenSlip format.

Returns the number of bytes from the source array that were processed, (1 or 2), or 0 if an end-of-packet (192) was encountered.

## Parameters

<i>ucChannel_</i>	Channel to encode the packet to
<i>aucBuf_</i>	Payload to encode
<i>usLen_</i>	Length of payload data

Definition at line 164 of file [slip.cpp](#).

16.81.2.7 void Slip::WriteVector ( K\_UCHAR *ucChannel\_*, SlipDataVector \* *astData\_*, K\_USHORT *usLen\_* )

Write a single message composed of multiple data-vector fragments.

Allows for transmitting complex data structures without requiring buffering. This operation is zero-copy.

## Parameters

<i>ucChannel_</i>	<a href="#">Message</a> channel
<i>astData_</i>	Pointer to the data vector
<i>usLen_</i>	Number of elements in the data vector

Definition at line 223 of file [slip.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/slip.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/slip.cpp](#)

## 16.82 SlipDataVector Struct Reference

Data structure used for vector-based SLIP data transmission.

```
#include <slip.h>
```

## Public Attributes

- K\_UCHAR [ucSize](#)  
*Size of the data buffer.*
- K\_UCHAR \* [pucData](#)  
*Pointer to the data buffer.*

### 16.82.1 Detailed Description

Data structure used for vector-based SLIP data transmission.

Allows for building and transmitting complex data structures without having to copy data into intermediate buffers.

Definition at line 59 of file [slip.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/slip.h](#)

## 16.83 SlipMux Class Reference

Static-class which implements a multiplexed stream of SLIP data over a single interface.

```
#include <slip_mux.h>
```

### Static Public Member Functions

- static void [Init](#) (const K\_CHAR \*pcDriverPath\_, K\_USHORT usRxSize\_, K\_UCHAR \*aucRx\_, K\_USHORT usTxSize\_, K\_UCHAR \*aucTx\_)  
*Attach a driver to the Slip-stream multiplexer and initialize the internal data associated with the module.*
- static void [InstallHandler](#) (K\_UCHAR ucChannel\_, Slip\_Channel pfHandler\_)  
*Install a slip handler function for the given communication channel.*
- static void [MessageReceive](#) ()  
*Wait for a valid packet to arrive, and call the appropriate handler function for the channel the message was attached to.*
- static Driver \* [GetDriver](#) ()  
*Return the pointer of the current driver used by the [SlipMux](#) module.*
- static MessageQueue \* [GetQueue](#) ()  
*Return the pointer to the message queue attached to the slip mux channel.*
- static void [SetQueue](#) (MessageQueue \*pclMessageQueue\_)  
*Set the message queue that will receive the notification when the slip mux channel has received data.*
- static Slip \* [GetSlip](#) ()  
*Return the pointer to the [SlipMux](#)' Slip object.*

### Static Private Attributes

- static MessageQueue \* [m\\_pclMessageQueue](#)
- static Driver \* [m\\_pclDriver](#)
- static Slip\_Channel [m\\_apfChannelHandlers](#) [SLIP\_CHANNEL\_COUNT] = {0}
- static K\_UCHAR [m\\_aucData](#) [SLIP\_BUFFER\_SIZE]
- static Semaphore [m\\_clSlipSem](#)
- static Slip [m\\_clSlip](#)

### 16.83.1 Detailed Description

Static-class which implements a multiplexed stream of SLIP data over a single interface.

Definition at line 43 of file [slip\\_mux.h](#).

### 16.83.2 Member Function Documentation

#### 16.83.2.1 static Driver\* SlipMux::GetDriver ( ) [inline],[static]

Return the pointer of the current driver used by the [SlipMux](#) module.

##### Returns

Pointer to the current handle owned by [SlipMux](#)

Definition at line 91 of file [slip\\_mux.h](#).

#### 16.83.2.2 static MessageQueue\* SlipMux::GetQueue ( ) [inline],[static]

Return the pointer to the message queue attached to the slip mux channel.

##### Returns

Pointer to the message Queue

Definition at line 99 of file [slip\\_mux.h](#).

#### 16.83.2.3 static Slip\* SlipMux::GetSlip ( ) [inline],[static]

Return the pointer to the [SlipMux](#)' [Slip](#) object.

##### Returns

Pointer to the [Slip](#) object

Definition at line 117 of file [slip\\_mux.h](#).

#### 16.83.2.4 void SlipMux::Init ( const K\_CHAR \* *pcDriverPath\_*, K\_USHORT *usRxSize\_*, K\_UCHAR \* *aucRx\_*, K\_USHORT *usTxSize\_*, K\_UCHAR \* *aucTx\_* ) [static]

Attach a driver to the Slip-stream multiplexer and initialize the internal data associated with the module.

Must be called before any of the other functions in this module are called.

##### Parameters

<i>pcDriverPath_</i>	Filesystem path to the driver to attach to
<i>usRxSize_</i>	Size of the RX Buffer to attach to the driver
<i>aucRx_</i>	Pointer to the RX Buffer to attach to the driver
<i>usTxSize_</i>	Size of the TX Buffer to attach to the driver
<i>aucTx_</i>	Pointer to the TX Buffer to attach to the driver

Definition at line 59 of file [slip\\_mux.cpp](#).

#### 16.83.2.5 void SlipMux::InstallHandler ( K\_UCHAR *ucChannel\_*, Slip\_Channel *pfHandler\_* ) [static]

Install a slip handler function for the given communication channel.

## Parameters

<i>ucChannel_</i>	Channel to attach the handler to
<i>pfHandler_</i>	Pointer to the handler function to attach

Definition at line 76 of file [slip\\_mux.cpp](#).

#### 16.83.2.6 void SlipMux::MessageReceive ( void ) [static]

Wait for a valid packet to arrive, and call the appropriate handler function for the channel the message was attached to.

This is essentially the entry point for a thread whose purpose is to service slip Rx data.

Definition at line 85 of file [slip\\_mux.cpp](#).

#### 16.83.2.7 static void SlipMux::SetQueue ( MessageQueue \* *pcMessageQueue\_* ) [inline],[static]

Set the message queue that will receive the notification when the slip mux channel has received data.

## Parameters

<i>pcMessage-Queue_</i>	Pointer to the message queue to use for notification.
-------------------------	---

Definition at line 108 of file [slip\\_mux.h](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/slip\\_mux.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/slip\\_mux.cpp](#)

## 16.84 SlipTerm Class Reference

Class implementing a simple debug terminal interface.

```
#include <slipterm.h>
```

### Public Member Functions

- void [Init](#) ()  
*Initialize the terminal by opening a handle to the serial interface attached at /dev/tty.*
- void [PrintLn](#) (const char \*szLine\_)  
*Print a string of text to the SLIP interface, multiplexed using the FunkenSlip terminal channel.*
- void [PrintLn](#) (K\_UCHAR ucSeverity\_, const char \*szLine\_)  
*Print a string of text to the SLIP interface, but only if the current logging verbosity level is greater than or equal to the specified message severity.*
- void [SetVerbosity](#) (K\_UCHAR ucLevel\_)  
*Set the logging verbosity level - the minimum severity level that will be printed to the terminal.*

### Private Member Functions

- K\_USHORT [StrLen](#) (const char \*szString\_)  
*Quick 'n' dirty StrLen functionality used for printing the string.*

## Private Attributes

- K\_UCHAR [m\\_ucVerbosity](#)  
*level greater than this Are not displayed.*
- Slip [m\\_clSlip](#)  
*Slip object that this module interfaces with.*

### 16.84.1 Detailed Description

Class implementing a simple debug terminal interface.

This is useful for printf style debugging.

Definition at line 40 of file [slipterm.h](#).

### 16.84.2 Member Function Documentation

#### 16.84.2.1 void SlipTerm::Init ( void )

Initialize the terminal by opening a handle to the serial interface attached at /dev/tty.

Must be called prior to using the print functionality.

Definition at line 26 of file [slipterm.cpp](#).

#### 16.84.2.2 void SlipTerm::PrintLn ( const char \* szLine\_ )

Print a string of text to the SLIP interface, multiplexed using the FunkenSlip terminal channel.

Parameters

<a href="#">szLine_</a>	String to print
-------------------------	-----------------

Definition at line 44 of file [slipterm.cpp](#).

#### 16.84.2.3 void SlipTerm::PrintLn ( K\_UCHAR ucSeverity\_, const char \* szLine\_ )

Print a string of text to the SLIP interface, but only if the current logging verbosity level is greater than or equal to the specified message severity.

Parameters

<a href="#">ucSeverity_</a>	<a href="#">Message</a> severity level, 0 = highest severity
<a href="#">szLine_</a>	String to print

Definition at line 56 of file [slipterm.cpp](#).

#### 16.84.2.4 void SlipTerm::SetVerbosity ( K\_UCHAR ucLevel\_ ) [inline]

Set the logging verbosity level - the minimum severity level that will be printed to the terminal.

The higher the number, the more chatty the output.

Definition at line 81 of file [slipterm.h](#).

#### 16.84.2.5 K\_USHORT SlipTerm::StrLen ( const char \* szString\_ ) [private]

Quick 'n' dirty StrLen functionality used for printing the string.

**Returns**

Length of the string (in bytes)

Definition at line 33 of file [slipterm.cpp](#).

**16.84.3 Member Data Documentation****16.84.3.1 K\_UCHAR SlipTerm::m\_ucVerbosity [private]**

level greater than this Are not displayed.

Verbosity level. Messages with a severity

Definition at line 92 of file [slipterm.h](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/slipterm.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/slipterm.cpp](#)

**16.85 StubControl Class Reference**

Stub control class, used for testing out the GUI framework where certain controls have not yet been implemented.

```
#include <gui.h>
```

Inheritance diagram for StubControl:

**Public Member Functions**

- virtual void [Init](#) ()  
*Initailize the control - must be called before use.*
- virtual void [Draw](#) ()  
*Redraw the control "cleanly".*
- virtual [GuiReturn\\_t](#) [ProcessEvent](#) ([GuiEvent\\_t](#) \*pstEvent\_)  
*Process an event sent to the control.*
- virtual void [Activate](#) (bool bActivate\_)  
*Activate or deactivate the current control - used when switching from one active control to another.*

**Additional Inherited Members****16.85.1 Detailed Description**

Stub control class, used for testing out the GUI framework where certain controls have not yet been implemented.

Definition at line 796 of file [gui.h](#).

## 16.85.2 Member Function Documentation

16.85.2.1 `virtual void StubControl::Activate ( bool bActivate_ ) [inline],[virtual]`

Activate or deactivate the current control - used when switching from one active control to another.

Parameters

<i>bActivate_</i>	- true to activate, false to deactivate
-------------------	---

Implements [GuiControl](#).

Definition at line 802 of file [gui.h](#).

16.85.2.2 `virtual void StubControl::Draw ( ) [inline],[virtual]`

Redraw the control "cleanly".

Subclass specific.

Implements [GuiControl](#).

Definition at line 800 of file [gui.h](#).

16.85.2.3 `virtual void StubControl::Init ( ) [inline],[virtual]`

Initialiize the control - must be called before use.

Implementation is subclass specific.

Implements [GuiControl](#).

Definition at line 799 of file [gui.h](#).

16.85.2.4 `virtual GuiReturn_t StubControl::ProcessEvent ( GuiEvent_t * pstEvent_ ) [inline],[virtual]`

Process an event sent to the control.

Subclass specific implementation.

Parameters

<i>pstEvent_</i>	Pointer to a struct containing the event data
------------------	---

Implements [GuiControl](#).

Definition at line 801 of file [gui.h](#).

The documentation for this class was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/gui.h](#)

## 16.86 SystemHeap Class Reference

The [SystemHeap](#) class implements a heap which is accessible from all components in the system.

```
#include <system_heap.h>
```

### Static Public Member Functions

- static void [Init](#) (void)

*Init Initialize the system heap prior to usage.*

- static void \* [Alloc](#) (K\_USHORT usSize\_)

*Alloc allocate a block of data from the heap.*

- static void [Free](#) (void \*pvData\_)

*Free free a block of data previously allocated from the heap.*

### Static Private Attributes

- static K\_UCHAR [m\\_pucRawHeap](#) [HEAP\_RAW\_SIZE]

*Raw heap buffer.*

- static [HeapConfig](#) [m\\_pclSystemHeapConfig](#) [HEAP\_NUM\_SIZES+1]

*Heap configuration metadata.*

- static [FixedHeap](#) [m\\_clSystemHeap](#)

*Heap management object.*

- static bool [m\\_bInit](#)

*True if initialized, false if uninitialized.*

### 16.86.1 Detailed Description

The [SystemHeap](#) class implements a heap which is accessible from all components in the system.

Definition at line 189 of file [system\\_heap.h](#).

### 16.86.2 Member Function Documentation

#### 16.86.2.1 void \* [SystemHeap::Alloc](#) ( K\_USHORT *usSize\_* ) [static]

[Alloc](#) allocate a block of data from the heap.

##### Parameters

<i>usSize_</i>	size of the block (in bytes) to allocate
----------------	--

##### Returns

pointer to a block of data allocated from the heap, or NULL on failure.

Definition at line 130 of file [system\\_heap.cpp](#).

#### 16.86.2.2 void [SystemHeap::Free](#) ( void \* *pvData\_* ) [static]

[Free](#) free a block of data previously allocated from the heap.

##### Parameters

<i>pvData_</i>	Pointer to a block of data allocated from the system heap
----------------	---

Definition at line 140 of file [system\\_heap.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/system\\_heap.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/system\\_heap.cpp](#)

## 16.87 TextFX\_t Struct Reference

### Public Attributes

- K\_UCHAR [ucFlags](#)  
*Text effects applied.*
- COLOR [uBGColor](#)  
*Background color for opaque backgrounds.*
- K\_USHORT [usRotateDeg](#)  
*Rotation in degrees.*
- K\_USHORT [usScaleX100](#)  
*Scaling factor, fixed point modulo 100.*
- K\_USHORT [usScaleY100](#)  
*Scaling factor, fixed point modulo 100.*

### 16.87.1 Detailed Description

Definition at line 160 of file [draw.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/draw.h](#)

## 16.88 Thread Class Reference

Object providing fundamental multitasking support in the kernel.

```
#include <thread.h>
```

Inheritance diagram for Thread:

### Public Member Functions

- void [Init](#) (K\_WORD \*paucStack\_, K\_USHORT usStackSize\_, K\_UCHAR ucPriority\_, [ThreadEntry\\_t](#) pfEntryPoint\_, void \*pvArg\_)  
*Initialize a thread prior to its use.*
- void [Start](#) ()  
*Start the thread - remove it from the stopped list, add it to the scheduler's list of threads (at the thread's set priority), and continue along.*
- void [Stop](#) ()  
*Stop a thread that's actively scheduled without destroying its stacks.*
- void [SetName](#) (const K\_CHAR \*szName\_)  
*Set the name of the thread - this is purely optional, but can be useful when identifying issues that come along when multiple threads are at play in a system.*
- const K\_CHAR \* [GetName](#) ()
- [ThreadList](#) \* [GetOwner](#) (void)

- Return the [ThreadList](#) where the thread belongs when it's in the active/ready state in the scheduler.

  - [ThreadList](#) \* [GetCurrent](#) (void)

Return the [ThreadList](#) where the thread is currently located.
- K\_UCHAR [GetPriority](#) (void)

Return the priority of the current thread.
- K\_UCHAR [GetCurPriority](#) (void)

Return the priority of the current thread.
- void [SetQuantum](#) (K\_USHORT usQuantum\_)

Set the thread's round-robin execution quantum.
- K\_USHORT [GetQuantum](#) (void)

Get the thread's round-robin execution quantum.
- void [SetCurrent](#) ([ThreadList](#) \*pclNewList\_)

Set the thread's current to the specified thread list.
- void [SetOwner](#) ([ThreadList](#) \*pclNewList\_)

Set the thread's owner to the specified thread list.
- void [SetPriority](#) (K\_UCHAR ucPriority\_)

Set the priority of the [Thread](#) (running or otherwise) to a different level.
- void [InheritPriority](#) (K\_UCHAR ucPriority\_)

Allow the thread to run at a different priority level (temporarily) for the purpose of avoiding priority inversions.
- void [Exit](#) ()

Remove the thread from being scheduled again.
- void [SetID](#) (K\_UCHAR ucID\_)

Set an 8-bit ID to uniquely identify this thread.
- K\_UCHAR [GetID](#) ()

Return the 8-bit ID corresponding to this thread.
- K\_USHORT [GetStackSlack](#) ()

Performs a (somewhat lengthy) check on the thread stack to check the amount of stack margin (or "slack") remaining on the stack.
- K\_USHORT [GetEventFlagMask](#) ()

[GetEventFlagMask](#) returns the thread's current event-flag mask, which is used in conjunction with the [EventFlag](#) blocking object type.
- void [SetEventFlagMask](#) (K\_USHORT usMask\_)

[SetEventFlagMask](#) Sets the active event flag bitfield mask.
- void [SetEventFlagMode](#) (EventFlagOperation\_t eMode\_)

[SetEventFlagMode](#) Sets the active event flag operation mode.
- EventFlagOperation\_t [GetEventFlagMode](#) ()

[GetEventFlagMode](#) Returns the thread's event flag's operating mode.
- [Timer](#) \* [GetTimer](#) ()

Return a pointer to the thread's timer object.
- void [SetExpired](#) (K\_BOOL bExpired\_)
- K\_BOOL [GetExpired](#) ()

## Static Public Member Functions

- static void [Sleep](#) (K\_ULONG ulTimeMs\_)

Put the thread to sleep for the specified time (in milliseconds).
- static void [USleep](#) (K\_ULONG ulTimeUs\_)

Put the thread to sleep for the specified time (in microseconds).
- static void [Yield](#) (void)

Yield the thread - this forces the system to call the scheduler and determine what thread should run next.

## Private Member Functions

- void [SetPriorityBase](#) (K\_UCHAR ucPriority\_)

## Static Private Member Functions

- static void [ContextSwitchSWI](#) (void)  
*This code is used to trigger the context switch interrupt.*

## Private Attributes

- K\_WORD \* [m\\_pwStackTop](#)  
*Pointer to the top of the thread's stack.*
- K\_WORD \* [m\\_pwStack](#)  
*Pointer to the thread's stack.*

*Size of the stack (in bytes)*
- K\_USHORT [m\\_usQuantum](#)  
*Thread quantum (in milliseconds)*
- K\_UCHAR [m\\_ucThreadID](#)  
*Thread ID.*
- K\_UCHAR [m\\_ucPriority](#)  
*Default priority of the thread.*
- K\_UCHAR [m\\_ucCurPriority](#)  
*Current priority of the thread (priority inheritance)*
- [ThreadEntry\\_t](#) [m\\_pfEntryPoint](#)  
*The entry-point function called when the thread starts.*
- void \* [m\\_pvArg](#)  
*Pointer to the argument passed into the thread's entrypoint.*
- const K\_CHAR \* [m\\_szName](#)  
*Thread name.*
- K\_USHORT [m\\_usFlagMask](#)  
*Event-flag mask.*
- [EventFlagOperation\\_t](#) [m\\_eFlagMode](#)  
*Event-flag mode.*
- [Timer](#) [m\\_clTimer](#)  
*Timer used for blocking-object timeouts.*
- K\_BOOL [m\\_bExpired](#)
- [ThreadList](#) \* [m\\_pclCurrent](#)  
*Pointer to the thread-list where the thread currently resides.*
- [ThreadList](#) \* [m\\_pclOwner](#)  
*Pointer to the thread-list where the thread resides when active.*

## Friends

- class [ThreadPort](#)

## Additional Inherited Members

### 16.88.1 Detailed Description

Object providing fundamental multitasking support in the kernel.

Definition at line 57 of file [thread.h](#).

### 16.88.2 Member Function Documentation

#### 16.88.2.1 void Thread::ContextSwitchSWI( void ) [static],[private]

This code is used to trigger the context switch interrupt.

Called whenever the kernel decides that it is necessary to swap out the current thread for the "next" thread.

Definition at line 351 of file [thread.cpp](#).

#### 16.88.2.2 void Thread::Exit( )

Remove the thread from being scheduled again.

The thread is effectively destroyed when this occurs. This is extremely useful for cases where a thread encounters an unrecoverable error and needs to be restarted, or in the context of systems where threads need to be created and destroyed dynamically.

This must not be called on the idle thread.

Definition at line 149 of file [thread.cpp](#).

#### 16.88.2.3 K\_UCHAR Thread::GetCurPriority( void ) [inline]

Return the priority of the current thread.

##### Returns

Priority of the current thread

Definition at line 160 of file [thread.h](#).

#### 16.88.2.4 ThreadList \* Thread::GetCurrent( void ) [inline]

Return the [ThreadList](#) where the thread is currently located.

##### Returns

Pointer to the thread's current list

Definition at line 141 of file [thread.h](#).

#### 16.88.2.5 K\_USHORT Thread::GetEventFlagMask( ) [inline]

GetEventFlagMask returns the thread's current event-flag mask, which is used in conjunction with the [EventFlag](#) blocking object type.

##### Returns

A copy of the thread's event flag mask

Definition at line 313 of file [thread.h](#).

**16.88.2.6** `EventFlagOperation_t Thread::GetEventFlagMode ( ) [inline]`

GetEventFlagMode Returns the thread's event flag's operating mode.

**Returns**

The thread's event flag mode.

Definition at line 332 of file [thread.h](#).

**16.88.2.7** `K_UCHAR Thread::GetID ( ) [inline]`

Return the 8-bit ID corresponding to this thread.

**Returns**

[Thread](#)'s 8-bit ID, set by the user

Definition at line 288 of file [thread.h](#).

**16.88.2.8** `const K_CHAR * Thread::GetName ( ) [inline]`**Returns**

Pointer to the name of the thread. If this is not set, will be NULL.

Definition at line 121 of file [thread.h](#).

**16.88.2.9** `ThreadList * Thread::GetOwner ( void ) [inline]`

Return the [ThreadList](#) where the thread belongs when it's in the active/ready state in the scheduler.

**Returns**

Pointer to the [Thread](#)'s owner list

Definition at line 132 of file [thread.h](#).

**16.88.2.10** `K_UCHAR Thread::GetPriority ( void ) [inline]`

Return the priority of the current thread.

**Returns**

Priority of the current thread

Definition at line 151 of file [thread.h](#).

**16.88.2.11** `K_USHORT Thread::GetQuantum ( void ) [inline]`

Get the thread's round-robin execution quantum.

**Returns**

The thread's quantum

Definition at line 179 of file [thread.h](#).

## 16.88.2.12 K\_USHORT Thread::GetStackSlack ( )

Performs a (somewhat lengthy) check on the thread stack to check the amount of stack margin (or "slack") remaining on the stack.

If you're having problems with blowing your stack, you can run this function at points in your code during development to see what operations cause problems. Also useful during development as a tool to optimally size thread stacks.

## Returns

The amount of slack (unused bytes) on the stack

! ToDo: Take into account stacks that grow up

Definition at line 240 of file [thread.cpp](#).

## 16.88.2.13 void Thread::InheritPriority ( K\_UCHAR ucPriority\_ )

Allow the thread to run at a different priority level (temporarily) for the purpose of avoiding priority inversions.

This should only be called from within the implementation of blocking-objects.

## Parameters

<i>ucPriority_</i>	New Priority to boost to.
--------------------	---------------------------

Definition at line 344 of file [thread.cpp](#).

## 16.88.2.14 void Thread::Init ( K\_WORD \* paucStack\_, K\_USHORT usStackSize\_, K\_UCHAR ucPriority\_, ThreadEntry\_t pfEntryPoint\_, void \* pvArg\_ )

Initialize a thread prior to its use.

Initialized threads are placed in the stopped state, and are not scheduled until the thread's start method has been invoked first.

## Parameters

<i>paucStack_</i>	Pointer to the stack to use for the thread
<i>usStackSize_</i>	Size of the stack (in bytes)
<i>ucPriority_</i>	Priority of the thread (0 = idle, 7 = max)
<i>pfEntryPoint_</i>	This is the function that gets called when the thread is started
<i>pvArg_</i>	Pointer to the argument passed into the thread's entrypoint function.

< Default round-robin thread quantum of 4ms

Definition at line 41 of file [thread.cpp](#).

## 16.88.2.15 void Thread::SetCurrent ( ThreadList \* pclNewList\_ ) [inline]

Set the thread's current to the specified thread list.

## Parameters

<i>pclNewList_</i>	Pointer to the threadlist to apply thread ownership
--------------------	---

Definition at line 189 of file [thread.h](#).

## 16.88.2.16 void Thread::SetEventFlagMask ( K\_USHORT usMask\_ ) [inline]

SetEventFlagMask Sets the active event flag bitfield mask.

## Parameters

<i>usMask_</i>	
----------------	--

Definition at line 319 of file [thread.h](#).

16.88.2.17 void Thread::SetEventFlagMode ( EventFlagOperation\_t *eMode\_* ) [inline]

SetEventFlagMode Sets the active event flag operation mode.

## Parameters

<i>eMode_</i>	Event flag operation mode, defines the logical operator to apply to the event flag.
---------------	---

Definition at line 326 of file [thread.h](#).

16.88.2.18 void Thread::SetID ( K\_UCHAR *ucID\_* ) [inline]

Set an 8-bit ID to uniquely identify this thread.

## Parameters

<i>ucID_</i>	8-bit <a href="#">Thread</a> ID, set by the user
--------------	--

Definition at line 279 of file [thread.h](#).

16.88.2.19 void Thread::SetName ( const K\_CHAR \* *szName\_* ) [inline]

Set the name of the thread - this is purely optional, but can be useful when identifying issues that come along when multiple threads are at play in a system.

## Parameters

<i>szName_</i>	Char string containing the thread name
----------------	--

Definition at line 113 of file [thread.h](#).

16.88.2.20 void Thread::SetOwner ( ThreadList \* *pclNewList\_* ) [inline]

Set the thread's owner to the specified thread list.

## Parameters

<i>pclNewList_</i>	Pointer to the threadlist to apply thread ownership
--------------------	---

Definition at line 198 of file [thread.h](#).

16.88.2.21 void Thread::SetPriority ( K\_UCHAR *ucPriority\_* )

Set the priority of the [Thread](#) (running or otherwise) to a different level.

This activity involves re-scheduling, and must be done so with due caution, as it may effect the determinism of the system.

This should *always* be called from within a critical section to prevent system issues.

## Parameters

---

<i>ucPriority_</i>	New priority of the thread
--------------------	----------------------------

Definition at line 301 of file [thread.cpp](#).

**16.88.2.22** void Thread::SetPriorityBase ( K\_UCHAR *ucPriority\_* ) [private]

Parameters

<i>ucPriority_</i>	
--------------------	--

Definition at line 291 of file [thread.cpp](#).

**16.88.2.23** void Thread::SetQuantum ( K\_USHORT *usQuantum\_* ) [inline]

Set the thread's round-robin execution quantum.

Parameters

<i>usQuantum_</i>	Thread's execution quantum (in milliseconds)
-------------------	--

Definition at line 170 of file [thread.h](#).

**16.88.2.24** void Thread::Sleep ( K\_ULONG *ulTimeMs\_* ) [static]

Put the thread to sleep for the specified time (in milliseconds).

Actual time slept may be longer (but not less than) the interval specified.

Parameters

<i>ulTimeMs_</i>	Time to sleep (in ms)
------------------	-----------------------

Definition at line 195 of file [thread.cpp](#).

**16.88.2.25** void Thread::Stop ( void )

Stop a thread that's actively scheduled without destroying its stacks.

Stopped threads can be restarted using the [Start\(\)](#) API.

Definition at line 121 of file [thread.cpp](#).

**16.88.2.26** void Thread::USleep ( K\_ULONG *ulTimeUs\_* ) [static]

Put the thread to sleep for the specified time (in microseconds).

Actual time slept may be longer (but not less than) the interval specified.

Parameters

<i>ulTimeUs_</i>	Time to sleep (in microseconds)
------------------	---------------------------------

Definition at line 217 of file [thread.cpp](#).

**16.88.2.27** void Thread::Yield ( void ) [static]

Yield the thread - this forces the system to call the scheduler and determine what thread should run next.

This is typically used when threads are moved in and out of the scheduler.

Definition at line 261 of file [thread.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/thread.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/thread.cpp](#)

## 16.89 ThreadList Class Reference

This class is used for building thread-management facilities, such as schedulers, and blocking objects.

```
#include <threadlist.h>
```

Inheritance diagram for ThreadList:

### Public Member Functions

- [ThreadList](#) ()  
*Default constructor - zero-initializes the data.*
- void [SetPriority](#) (K\_UCHAR ucPriority\_)  
*Set the priority of this threadlist (if used for a scheduler).*
- void [SetFlagPointer](#) (K\_UCHAR \*pucFlag\_)  
*Set the pointer to a bitmap to use for this threadlist.*
- void [Add](#) (LinkListNode \*node\_)  
*Add a thread to the threadlist.*
- void [Add](#) (LinkListNode \*node\_, K\_UCHAR \*pucFlag\_, K\_UCHAR ucPriority\_)  
*Add a thread to the threadlist, specifying the flag and priority at the same time.*
- void [Remove](#) (LinkListNode \*node\_)  
*Remove the specified thread from the threadlist.*
- [Thread \\*](#) [HighestWaiter](#) ()  
*Return a pointer to the highest-priority thread in the thread-list.*

### Private Attributes

- K\_UCHAR [m\\_ucPriority](#)  
*Priority of the threadlist.*
- K\_UCHAR \* [m\\_pucFlag](#)  
*Pointer to the bitmap/flag to set when used for scheduling.*

### Additional Inherited Members

#### 16.89.1 Detailed Description

This class is used for building thread-management facilities, such as schedulers, and blocking objects.

Definition at line 34 of file [threadlist.h](#).

## 16.89.2 Member Function Documentation

### 16.89.2.1 void ThreadList::Add ( LinkListNode \* *node\_* ) [virtual]

Add a thread to the threadlist.

Parameters

<i>node_</i>	Pointer to the thread (link list node) to add to the list
--------------	---

Reimplemented from [CircularLinkList](#).

Definition at line 46 of file [threadlist.cpp](#).

### 16.89.2.2 void ThreadList::Add ( LinkListNode \* *node\_*, K\_UCHAR \* *pucFlag\_*, K\_UCHAR *ucPriority\_* )

Add a thread to the threadlist, specifying the flag and priority at the same time.

Parameters

<i>node_</i>	Pointer to the thread to add (link list node)
<i>pucFlag_</i>	Pointer to the bitmap flag to set (if used in a scheduler context), or NULL for non-scheduler.
<i>ucPriority_</i>	Priority of the threadlist

Definition at line 62 of file [threadlist.cpp](#).

### 16.89.2.3 Thread \* ThreadList::HighestWaiter ( )

Return a pointer to the highest-priority thread in the thread-list.

Returns

Pointer to the highest-priority thread

Definition at line 87 of file [threadlist.cpp](#).

### 16.89.2.4 void ThreadList::Remove ( LinkListNode \* *node\_* ) [virtual]

Remove the specified thread from the threadlist.

Parameters

<i>node_</i>	Pointer to the thread to remove
--------------	---------------------------------

Reimplemented from [CircularLinkList](#).

Definition at line 71 of file [threadlist.cpp](#).

### 16.89.2.5 void ThreadList::SetFlagPointer ( K\_UCHAR \* *pucFlag\_* )

Set the pointer to a bitmap to use for this threadlist.

Once again, only needed when the threadlist is being used for scheduling purposes.

Parameters

<i>pucFlag_</i>	Pointer to the bitmap flag
-----------------	----------------------------

Definition at line 40 of file [threadlist.cpp](#).

16.89.2.6 void ThreadList::SetPriority ( K\_UCHAR *ucPriority\_* )

Set the priority of this threadlist (if used for a scheduler).

## Parameters

<i>ucPriority_</i>	Priority level of the thread list
--------------------	-----------------------------------

Definition at line 34 of file [threadlist.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/threadlist.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/threadlist.cpp](#)

## 16.90 ThreadPort Class Reference

Class defining the architecture specific functions required by the kernel.

```
#include <threadport.h>
```

### Static Public Member Functions

- static void [StartThreads](#) ()  
*Function to start the scheduler, initial threads, etc.*

### Static Private Member Functions

- static void [InitStack](#) ([Thread](#) \*pstThread\_)  
*Initialize the thread's stack.*

### Friends

- class [Thread](#)

### 16.90.1 Detailed Description

Class defining the architecture specific functions required by the kernel.

This is limited (at this point) to a function to start the scheduler, and a function to initialize the default stack-frame for a thread.

Definition at line 167 of file [threadport.h](#).

### 16.90.2 Member Function Documentation

16.90.2.1 void [ThreadPort::InitStack](#) ( [Thread](#) \* *pstThread\_* ) [static], [private]

Initialize the thread's stack.

## Parameters

<i>pstThread_</i>	Pointer to the thread to initialize
-------------------	-------------------------------------

Definition at line 37 of file [threadport.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/threadport.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/threadport.cpp](#)

## 16.91 Tile\_8x8 Class Reference

### Public Member Functions

- void [LoadTile](#) ([TileDef\\_t](#) \*pstTileDef\_)  
*LoadTile.*
- void [Render](#) ([GraphicsDriver](#) \*pclDriver\_, K\_USHORT usX\_, K\_USHORT usY\_)  
*Render.*

### Private Attributes

- COLOR [m\\_auTileBuffer](#) [TILE\_8x8\_BUFFER\_SIZE]  
*m\_auTileBuffer Object's local storage for tile data*
- K\_UCHAR [m\\_ucWidth](#)  
*m\_ucWidth Width of the tile (may be smaller than width of buffer)*
- K\_UCHAR [m\\_ucHeight](#)  
*m\_ucHeight Height of the tile (may be smaler than the height of buffer)*

#### 16.91.1 Detailed Description

Definition at line 63 of file [tiles.h](#).

#### 16.91.2 Member Function Documentation

##### 16.91.2.1 void Tile\_8x8::LoadTile ( TileDef\_t \* pstTileDef\_ )

*LoadTile.*

Load the tile specified by pstTileDef\_ into memory. This takes some time as it parses the indexed colors, does a lookup, and then writes to the local tile buffer. Once a tile has been loaded, it can be rendered any number of times.

**Parameters**

<i>pstTileDef_</i>	Pointer to a struct containing configuration data for the tile to be loaded.
--------------------	--

Definition at line 24 of file [tiles.cpp](#).

##### 16.91.2.2 void Tile\_8x8::Render ( GraphicsDriver \* pclDriver\_, K\_USHORT usX\_, K\_USHORT usY\_ )

*Render.*

Render loaded tile data to a specific location on a specified display.

**Parameters**

<i>pclDriver_</i>	Pointer to the graphics driver to render with
<i>usX_</i>	Leftmost pixel index
<i>usY_</i>	Topmost pixel index

Definition at line 51 of file [tiles.cpp](#).

The documentation for this class was generated from the following files:

- /home/moslevin/mark3-source/embedded/stage/src/tiles.h
- /home/moslevin/mark3-source/embedded/stage/src/tiles.cpp

## 16.92 TileDef\_t Struct Reference

[TileDef\\_t](#) Structure defining parameters for a color-indexed tile.

```
#include <tiles.h>
```

### Public Attributes

- [TileFormat\\_t m\\_eFormat](#)  
*Color-indexing of the tile (bits-per-pixel)*
- [K\\_UCHAR \\* m\\_pucData](#)  
*Pointer to color-indexed tile data.*
- [COLOR \\* m\\_puPalette](#)  
*Pointer to a palette assigned to this tile.*
- [K\\_UCHAR m\\_ucHeight](#)  
*Height of the tile (in pixels)*
- [K\\_UCHAR m\\_ucWidth](#)  
*Width of the tile (in pixels)*

### 16.92.1 Detailed Description

[TileDef\\_t](#) Structure defining parameters for a color-indexed tile.

Definition at line 48 of file [tiles.h](#).

The documentation for this struct was generated from the following file:

- `/home/moslevin/mark3-source/embedded/stage/src/tiles.h`

## 16.93 Timer Class Reference

[Timer](#) - an event-driven execution context based on a specified time interval.

```
#include <timerlist.h>
```

Inheritance diagram for [Timer](#):

### Public Member Functions

- [Timer](#) ()  
*Default Constructor - zero-initializes all internal data.*
- [void Init](#) ()  
*Re-initialize the [Timer](#) to default values.*
- [void Start](#) ([K\\_UCHAR](#) bRepeat\_, [K\\_ULONG](#) ulIntervalMs\_, [TimerCallback\\_t](#) pfCallback\_, [void \\*pvData\\_](#))  
*Start a timer using default ownership, using repeats as an option, and millisecond resolution.*
- [void Start](#) ([K\\_UCHAR](#) bRepeat\_, [K\\_ULONG](#) ulIntervalMs\_, [K\\_ULONG](#) ulToleranceMs\_, [TimerCallback\\_t](#) pfCallback\_, [void \\*pvData\\_](#))

- Start a timer using default ownership, using repeats as an option, and millisecond resolution.*

  - void [Stop](#) ()
 

*Stop a timer already in progress.*
  - void [SetFlags](#) (K\_UCHAR ucFlags\_)
 

*Set the timer's flags based on the bits in the ucFlags\_ argument.*
  - void [SetCallback](#) (TimerCallback\_t pfCallback\_)
 

*Define the callback function to be executed on expiry of the timer.*
  - void [SetData](#) (void \*pvData\_)
 

*Define a pointer to be sent to the timer callbacak on timer expiry.*
  - void [SetOwner](#) (Thread \*pclOwner\_)
 

*Set the owner-thread of this timer object (all timers must be owned by a thread).*
  - void [SetIntervalTicks](#) (K\_ULONG ulTicks\_)
 

*Set the timer expiry in system-ticks (platform specific!)*
  - void [SetIntervalSeconds](#) (K\_ULONG ulSeconds\_)
 

*! The next three cost us 330 bytes of flash on AVR...*
  - K\_ULONG [GetInterval](#) ()
 

*Set the timer expiry interval in milliseconds (platform agnostic)*
  - void [SetIntervalMSeconds](#) (K\_ULONG ulMSeconds\_)
 

*Set the timer expiry interval in microseconds (platform agnostic)*
  - void [SetIntervalUSeconds](#) (K\_ULONG ulUSeconds\_)
 

*Set the timer's maximum tolerance in order to synchronize timer processing with other timers in the system.*

## Private Attributes

- K\_UCHAR [m\\_ucFlags](#)

*Flags for the timer, defining if the timer is one-shot or repeated.*
- TimerCallback\_t [m\\_pfCallback](#)

*Pointer to the callback function.*
- K\_ULONG [m\\_ulInterval](#)

*Interval of the timer in timer ticks.*
- K\_ULONG [m\\_ulTimeLeft](#)

*Time remaining on the timer.*
- K\_ULONG [m\\_ulTimerTolerance](#)

*Maximum tolerance (used for timer harmonization)*
- Thread \* [m\\_pclOwner](#)

*Pointer to the owner thread.*
- void \* [m\\_pvData](#)

*Pointer to the callback data.*

## Friends

- class [TimerList](#)

## Additional Inherited Members

### 16.93.1 Detailed Description

[Timer](#) - an event-driven execution context based on a specified time interval.

This inherits from a [LinkListNode](#) for ease of management by a global [TimerList](#) object.

Definition at line 98 of file [timerlist.h](#).

## 16.93.2 Member Function Documentation

### 16.93.2.1 void Timer::SetCallback ( TimerCallback\_t *pfCallback\_* ) [inline]

Define the callback function to be executed on expiry of the timer.

Parameters

<i>pfCallback_</i>	Pointer to the callback function to call
--------------------	--

Definition at line 159 of file [timerlist.h](#).

### 16.93.2.2 void Timer::SetData ( void \* *pvData\_* ) [inline]

Define a pointer to be sent to the timer callbcaek on timer expiry.

Parameters

<i>pvData_</i>	Pointer to data to pass as argument into the callback
----------------	---

Definition at line 168 of file [timerlist.h](#).

### 16.93.2.3 void Timer::SetFlags ( K\_UCHAR *ucFlags\_* ) [inline]

Set the timer's flags based on the bits in the *ucFlags\_* argument.

Parameters

<i>ucFlags_</i>	Flags to assign to the timer object. <code>TIMERLIST_FLAG_ONE_SHOT</code> for a one-shot timer, 0 for a continuous timer.
-----------------	---

Definition at line 150 of file [timerlist.h](#).

### 16.93.2.4 void Timer::SetIntervalMSeconds ( K\_ULONG *uIMSeconds\_* )

Set the timer expiry interval in milliseconds (platform agnostic)

Parameters

<i>uIMSeconds_</i>	Time in milliseconds
--------------------	----------------------

Definition at line 304 of file [timerlist.cpp](#).

### 16.93.2.5 void Timer::SetIntervalSeconds ( K\_ULONG *uSeconds\_* )

! The next three cost us 330 bytes of flash on AVR...

Set the timer expiry interval in seconds (platform agnostic)

Parameters

<i>uSeconds_</i>	Time in seconds
------------------	-----------------

Definition at line 298 of file [timerlist.cpp](#).

### 16.93.2.6 void Timer::SetIntervalTicks ( K\_ULONG *uTicks\_* )

Set the timer expiry in system-ticks (platform specific!)

## Parameters

<i>ulTicks_</i>	Time in ticks
-----------------	---------------

Definition at line 290 of file [timerlist.cpp](#).

16.93.2.7 void Timer::SetIntervalUSecds ( K\_ULONG *ulUSecds\_* )

Set the timer expiry interval in microseconds (platform agnostic)

## Parameters

<i>ulUSecds_</i>	Time in microseconds
------------------	----------------------

Definition at line 310 of file [timerlist.cpp](#).

16.93.2.8 void Timer::SetOwner ( Thread \* *pclOwner\_* ) [inline]

Set the owner-thread of this timer object (all timers must be owned by a thread).

## Parameters

<i>pclOwner_</i>	Owner thread of this timer object
------------------	-----------------------------------

Definition at line 178 of file [timerlist.h](#).

16.93.2.9 void Timer::SetTolerance ( K\_ULONG *ulTicks\_* )

Set the timer's maximum tolerance in order to synchronize timer processing with other timers in the system.

## Parameters

<i>ulTicks_</i>	Maximum tolerance in ticks
-----------------	----------------------------

Definition at line 316 of file [timerlist.cpp](#).

16.93.2.10 void Timer::Start ( K\_UCHAR *bRepeat\_*, K\_ULONG *ulIntervalMs\_*, TimerCallback\_t *pfCallback\_*, void \* *pvData\_* )

Start a timer using default ownership, using repeats as an option, and millisecond resolution.

## Parameters

<i>bRepeat_</i>	0 - timer is one-shot. 1 - timer is repeating.
<i>ulIntervalMs_</i>	- Interval of the timer in milliseconds
<i>pfCallback_</i>	- Function to call on timer expiry
<i>pvData_</i>	- Data to pass into the callback function

Definition at line 259 of file [timerlist.cpp](#).

16.93.2.11 void Timer::Start ( K\_UCHAR *bRepeat\_*, K\_ULONG *ulIntervalMs\_*, K\_ULONG *ulToleranceMs\_*, TimerCallback\_t *pfCallback\_*, void \* *pvData\_* )

Start a timer using default ownership, using repeats as an option, and millisecond resolution.

## Parameters

<i>bRepeat_</i>	0 - timer is one-shot. 1 - timer is repeating.
-----------------	--

<i>ulIntervalMs_</i>	- Interval of the timer in milliseconds
<i>ulToleranceMs</i>	- Allow the timer expiry to be delayed by an additional maximum time, in order to have as many timers expire at the same time as possible.
<i>pfCallback_</i>	- Function to call on timer expiry
<i>pvData_</i>	- Data to pass into the callback function

Definition at line 277 of file [timerlist.cpp](#).

#### 16.93.2.12 void Timer::Stop ( void )

Stop a timer already in progress.

Has no effect on timers that have already been stopped.

Definition at line 284 of file [timerlist.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/timerlist.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/timerlist.cpp](#)

## 16.94 TimerEvent\_t Struct Reference

[Timer](#) UI event structure.

```
#include <gui.h>
```

### Public Attributes

- K\_USHORT [usTicks](#)  
*Number of clock ticks (arbitrary) that have elapsed.*

#### 16.94.1 Detailed Description

[Timer](#) UI event structure.

Definition at line 177 of file [gui.h](#).

The documentation for this struct was generated from the following file:

## 16.95 TimerList Class Reference

[TimerList](#) class - a doubly-linked-list of timer objects.

```
#include <timerlist.h>
```

Inheritance diagram for TimerList:

## Public Member Functions

- void [Init](#) ()  
*Initialize the [TimerList](#) object.*
- void [Add](#) ([Timer](#) \*pclListNode\_)  
*Add a timer to the [TimerList](#).*
- void [Remove](#) ([Timer](#) \*pclListNode\_)  
*Remove a timer from the [TimerList](#), cancelling its expiry.*
- void [Process](#) ()  
*Process all timers in the timerlist as a result of the timer expiring.*

## Private Attributes

- K\_ULONG [m\\_ulNextWakeup](#)  
*The time (in system clock ticks) of the next wakeup event.*
- K\_UCHAR [m\\_bTimerActive](#)  
*Whether or not the timer is active.*

## Additional Inherited Members

### 16.95.1 Detailed Description

[TimerList](#) class - a doubly-linked-list of timer objects.

Definition at line 260 of file [timerlist.h](#).

### 16.95.2 Member Function Documentation

#### 16.95.2.1 void [TimerList::Add](#) ( [Timer](#) \* [pclListNode\\_](#) )

Add a timer to the [TimerList](#).

Parameters

<a href="#">pclListNode_</a>	Pointer to the <a href="#">Timer</a> to Add
------------------------------	---

Definition at line 49 of file [timerlist.cpp](#).

#### 16.95.2.2 void [TimerList::Init](#) ( void )

Initialize the [TimerList](#) object.

Must be called before using the object.

Definition at line 42 of file [timerlist.cpp](#).

## 16.95.2.3 void TimerList::Process ( void )

Process all timers in the timerlist as a result of the timer expiring.

This will select a new timer epoch based on the next timer to expire. ToDo - figure out if we need to deal with any overtime here.

Definition at line 114 of file [timerlist.cpp](#).

## 16.95.2.4 void TimerList::Remove ( Timer \* pcListNode\_ )

Remove a timer from the [TimerList](#), cancelling its expiry.

## Parameters

<a href="#">pcListNode_</a>	Pointer to the <a href="#">Timer</a> to remove
-----------------------------	--

Definition at line 97 of file [timerlist.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/timerlist.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/timerlist.cpp](#)

## 16.96 TimerScheduler Class Reference

"Static" Class used to interface a global [TimerList](#) with the rest of the kernel.

```
#include <timerlist.h>
```

### Static Public Member Functions

- static void [Init](#) ()  
*Initialize the timer scheduler.*
- static void [Add](#) ([Timer](#) \*pcListNode\_)  
*Add a timer to the timer scheduler.*
- static void [Remove](#) ([Timer](#) \*pcListNode\_)  
*Remove a timer from the timer scheduler.*
- static void [Process](#) ()  
*This function must be called on timer expiry (from the timer's ISR context).*

### Static Private Attributes

- static [TimerList](#) [m\\_cTimerList](#)  
*[TimerList](#) object manipulated by the [Timer Scheduler](#).*

### 16.96.1 Detailed Description

"Static" Class used to interface a global [TimerList](#) with the rest of the kernel.

Definition at line 310 of file [timerlist.h](#).

## 16.96.2 Member Function Documentation

16.96.2.1 void TimerScheduler::Add ( Timer \* *pcListNode\_* ) [inline],[static]

Add a timer to the timer scheduler.

Adding a timer implicitly starts the timer as well.

Parameters

<i>pcListNode_</i>	Pointer to the timer list node to add
--------------------	---------------------------------------

Definition at line 329 of file [timerlist.h](#).

16.96.2.2 void TimerScheduler::Init ( void ) [inline],[static]

Initialize the timer scheduler.

Must be called before any timer, or timer-derived functions are used.

Definition at line 319 of file [timerlist.h](#).

16.96.2.3 void TimerScheduler::Process ( void ) [inline],[static]

This function must be called on timer expiry (from the timer's ISR context).

This will result in all timers being updated based on the epoch that just elapsed. New timer epochs are set based on the next timer to expire.

Definition at line 351 of file [timerlist.h](#).

16.96.2.4 void TimerScheduler::Remove ( Timer \* *pcListNode\_* ) [inline],[static]

Remove a timer from the timer scheduler.

May implicitly stop the timer if this is the only active timer scheduled.

Parameters

<i>pcListNode_</i>	Pointer to the timer list node to remove
--------------------	--

Definition at line 340 of file [timerlist.h](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/timerlist.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/timerlist.cpp](#)

## 16.97 Token\_t Struct Reference

Token descriptor struct format.

```
#include <memutil.h>
```

### Public Attributes

- const K\_CHAR \* [pcToken](#)  
*Pointer to the beginning of the token string.*
- K\_UCHAR [ucLen](#)  
*Length of the token (in bytes)*

### 16.97.1 Detailed Description

Token descriptor struct format.

Definition at line 32 of file [memutil.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/memutil.h](#)

## 16.98 TouchEvent\_t Struct Reference

Touch UI event structure.

```
#include <gui.h>
```

### Public Attributes

- K\_USHORT [usX](#)  
*Absolute touch location (pixels)*
- K\_USHORT [usY](#)  
*Absolute touch location (pixels)*

### 16.98.1 Detailed Description

Touch UI event structure.

Definition at line 125 of file [gui.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/gui.h](#)

## 16.99 Transaction Class Reference

The [Transaction](#) class.

```
#include <transaction.h>
```

Inheritance diagram for Transaction:

### Public Member Functions

- void [Set](#) (K\_USHORT usCode\_, void \*pvData\_)  
*Set.*
- K\_USHORT [GetCode](#) ()

- GetCode.*
- void \* [GetData](#) ()
- GetData.*

## Private Attributes

- K\_USHORT [m\\_usCode](#)
- Data code, defined by the blocking object using transactions.*
- void \* [m\\_pvData](#)
- Abstract data, which is defined by the code.*

## Additional Inherited Members

### 16.99.1 Detailed Description

The [Transaction](#) class.

The [Transaction](#) class implements "kernel transaction" functionality used by blocking objects within the kernel.

Each [Transaction](#) object is essentially a FIFO node, which is used to represent an operation that takes place on a blocking object. These operations include things like posting or pending a semaphore, claiming or releasing a mutex, or a thread timeout on a blocking object. Transactions are used exclusively with [TransactionQueue](#)'s to serialize access to blocking objects in order to implement lockless kernel operations with interrupts enabled.

For simplicity, each transaction is implemented as a simple Key/Value pair - the "Code" value is interpreted differently based on the type of blocking object, and the "Data" value is depending on the value held in the code. For examples of how Transactions are used, see the kernel, mutex and event-flag code.

Definition at line 51 of file [transaction.h](#).

### 16.99.2 Member Function Documentation

#### 16.99.2.1 K\_USHORT Transaction::GetCode ( ) [inline]

*GetCode.*

Return the value held by the Code field

#### Returns

value of the Code field

Definition at line 75 of file [transaction.h](#).

#### 16.99.2.2 void\* Transaction::GetData ( ) [inline]

*GetData.*

Return the abstract data value held in the object

#### Returns

Abstract data value held in the object

Definition at line 87 of file [transaction.h](#).

16.99.2.3 `void Transaction::Set ( K_USHORT usCode_, void * pvData_ ) [inline]`

Set.

Provide access to set the code/data fields in the object

## Parameters

<i>usCode_</i>	Code value to set
<i>pvData_</i>	Abstract data value to set

Definition at line 62 of file [transaction.h](#).

The documentation for this class was generated from the following file:

- [/home/moslevin/mark3-source/embedded/stage/src/transaction.h](#)

## 16.100 TransactionQueue Class Reference

The [TransactionQueue](#) class.

```
#include <transaction.h>
```

Inheritance diagram for TransactionQueue:

### Public Member Functions

- void [Enqueue](#) (K\_USHORT usData\_, void \*pvData\_)  
*Enqueue.*
- [Transaction \\*](#) [Dequeue](#) ()  
*Dequeue.*
- void [Finish](#) ([Transaction \\*](#)pcTransaction\_)  
*Finish.*

### Static Public Member Functions

- static void [GlobalQueueInit](#) ()  
*GlobalQueueInit.*

### Static Private Attributes

- static [DoubleLinkedList](#) [m\\_clGlobalQueue](#)  
*List object used to manage all transactions.*
- static [Transaction](#) [m\\_aclTransactions](#) [[TRANSACTION\\_QUEUE\\_SIZE](#)]  
*Static array of objects managed in the above list.*

### Additional Inherited Members

#### 16.100.1 Detailed Description

The [TransactionQueue](#) class.

A kernel transaction queue is a construct used to build blocking objects which disable interrupts for as short a period of time as possible. Instead of disabling interrupts for the duration of a blocking object operation (i.e. mutex claim or semaphore post), we instead serialize access to the object using a FIFO containing a list of pending actions. Coupled with [Atomic](#) locking operations, the kernel can guarantee that only one thread has permission to process the object's transaction queue, while all other concurrent threads/interrupts (which then fail to claim the object's lock) are only allowed to add transactions to it. In this way, we can keep interrupts enabled for the vast majority of kernel/blocking-object calls, resulting in a much more deterministic, responsive system.

Transactions are very short-lived - i.e. a queue will only have more than 1 pending transaction if pre-empted by interrupts during queue processing within a kernel call. As a result, we maintain a small, global pool of transaction objects which are allocated as-necessary in order to service demand. These [Transaction](#) objects are shared among all blocking objects within the system.

Typical usage of a [TransactionQueue](#) object is as follows:

```
Enqueue(code, data); // Add a new node to the queue to be processed after
```

```
// – somewhere else in the code –
```

```
// Process the queue, one node at a time Transaction *pclTransaction; while ((pclTransaction = Dequeue\(\)) != 0) { //
Do something with the transaction data MyProcessFuntion(pclTransaction);
```

```
// Return the object back to the global queue when done. Finish(pclTransaction); }
```

Definition at line 138 of file [transaction.h](#).

## 16.100.2 Member Function Documentation

### 16.100.2.1 [Transaction](#) \* [TransactionQueue::Dequeue](#) ( )

[Dequeue](#).

Pops the first item in the queue, returning its pointer back to the caller.

Note - [Dequeue\(\)](#) does not return the node back to the global pool. Once the transaction has been processed, it must be returned back by calling the [Finish\(\)](#) method.

#### Returns

Pointer to the head node in the list, 0 if empty

Definition at line 56 of file [transaction.cpp](#).

### 16.100.2.2 void [TransactionQueue::Enqueue](#) ( [K\\_USHORT](#) *usData\_*, void \* *pvData\_* )

[Enqueue](#).

Enqueue a new entry to the tail of the transaction queue. This pops a node from the global transaction pool, populates it with the data in the fields, and adds the node to the end of this queue.

#### Parameters

<i>usData_</i>	Data value to encode
<i>pvData_</i>	Abstract data associated with the node

Definition at line 37 of file [transaction.cpp](#).

### 16.100.2.3 void [TransactionQueue::Finish](#) ( [Transaction](#) \* *pclTransaction\_* )

[Finish](#).

Return a previously dequeued transaction object back to the global transaction queue. Any [Dequeue](#)'d object must be returned by calling this function to avoid leaks.

## Parameters

<code>pciTransaction_</code>	Pointer to a transaction object to return back to the queue.
------------------------------	--

Definition at line 72 of file [transaction.cpp](#).

#### 16.100.2.4 void TransactionQueue::GlobalQueueInit ( ) [static]

GlobalQueueInit.

This static method is called to initialize the global transaction pool and its included transaction objects.

Definition at line 28 of file [transaction.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/transaction.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/transaction.cpp](#)

## 16.101 UnitTest Class Reference

Class used to implement a simple unit-testing framework.

```
#include <unit_test.h>
```

### Public Member Functions

- void [SetName](#) (const K\_CHAR \*szName\_)  
*Set the name of the test object.*
- void [Start](#) ()  
*Start a new test iteration.*
- void [Pass](#) ()

- void **ExpectFailGreaterThanEquals** (K\_LONG IVal\_, K\_LONG IExpression\_)
- void **ExpectFailLessThanEquals** (K\_LONG IVal\_, K\_LONG IExpression\_)
- void **Complete** ()  
*Complete the test.*
- const K\_CHAR \* **GetName** ()  
*Get the name of the tests associated with this object.*
- K\_BOOL **GetResult** ()  
*Return the result of the last test.*
- K\_USHORT **GetPassed** ()  
*Return the total number of test points/iterations passed.*
- K\_USHORT **GetFailed** ()  
*Return the number of failed test points/iterations.*
- K\_USHORT **GetTotal** ()  
*Return the total number of iterations/test-points executed.*

### Private Attributes

- const K\_CHAR \* **m\_szName**  
*Name of the tests performed.*
- K\_BOOL **m\_bIsActive**  
*Whether or not the test is active.*
- K\_UCHAR **m\_bComplete**  
*Whether or not the test is complete.*
- K\_BOOL **m\_bStatus**  
*Status of the last-run test.*
- K\_USHORT **m\_usIterations**  
*Number of iterations executed.*
- K\_USHORT **m\_usPassed**  
*Number of iterations that have passed.*

### 16.101.1 Detailed Description

Class used to implement a simple unit-testing framework.

Definition at line 28 of file [unit\\_test.h](#).

### 16.101.2 Member Function Documentation

#### 16.101.2.1 void UnitTest::Complete ( ) [inline]

Complete the test.

Once a test has been completed, no new iterations can be started (i.e [Start\(\)](#)/[Pass\(\)](#)/[Fail\(\)](#) will have no effect).

Definition at line 157 of file [unit\\_test.h](#).

**16.101.2.2 K\_USHORT UnitTest::GetFailed ( ) [inline]**

Return the number of failed test points/iterations.

**Returns**

Failed test point/iteration count

Definition at line 193 of file [unit\\_test.h](#).

**16.101.2.3 const K\_CHAR \* UnitTest::GetName ( ) [inline]**

Get the name of the tests associated with this object.

**Returns**

Name of the test

Definition at line 166 of file [unit\\_test.h](#).

**16.101.2.4 K\_USHORT UnitTest::GetPassed ( ) [inline]**

Return the total number of test points/iterations passed.

**Returns**

Count of all successful test points/iterations

Definition at line 184 of file [unit\\_test.h](#).

**16.101.2.5 K\_BOOL UnitTest::GetResult ( ) [inline]**

Return the result of the last test.

**Returns**

Status of the last run test (false = fail, true = pass)

Definition at line 175 of file [unit\\_test.h](#).

**16.101.2.6 K\_USHORT UnitTest::GetTotal ( ) [inline]**

Return the total number of iterations/test-points executed.

**Returns**

Total number of iterations/test-points executed

Definition at line 202 of file [unit\\_test.h](#).

**16.101.2.7 void UnitTest::SetName ( const K\_CHAR \* szName\_ ) [inline]**

Set the name of the test object.

## Parameters

<code>szName_</code>	Name of the tests associated with this object
----------------------	---

Definition at line 41 of file [unit\\_test.h](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/unit\\_test.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/unit\\_test.cpp](#)

## 16.102 WriteBuffer16 Class Reference

This class is used to provide a general-purpose, fully thread-safe circular buffer implementation which can be used for creating tracebuffers, data logging queues, transaction queues, etc.

```
#include <writebuf16.h>
```

### Public Member Functions

- void [SetBuffers](#) (K\_USHORT \*pusData\_, K\_USHORT usSize\_)  
*Assign the data to be used as storage for this circular buffer.*
- void [SetCallback](#) ([WriteBufferCallback](#) pfCallback\_)  
*Set the callback function to be called when the buffer hits 50% of its capacity, and again when the buffer rolls over completely.*
- void [WriteData](#) (K\_USHORT \*pusBuf\_, K\_USHORT usLen\_)  
*Write an array of values to the circular buffer.*
- void [WriteVector](#) (K\_USHORT \*\*ppusBuf\_, K\_USHORT \*pusLen\_, K\_UCHAR ucCount\_)  
*Write a multi-part vector to the circular buffer.*

### Private Attributes

- K\_USHORT \* [m\\_pusData](#)  
*Pointer to the circular buffer data.*
- volatile K\_USHORT [m\\_usSize](#)  
*Size of the buffer.*
- volatile K\_USHORT [m\\_usHead](#)  
*Current head element (where data is written)*
- volatile K\_USHORT [m\\_usTail](#)  
*Current tail element (where data is read)*
- [WriteBufferCallback](#) [m\\_pfCallback](#)  
*Buffer callback function.*

### 16.102.1 Detailed Description

This class is used to provide a general-purpose, fully thread-safe circular buffer implementation which can be used for creating tracebuffers, data logging queues, transaction queues, etc.

We use it for implementing a debug print journal.

Definition at line 37 of file [writebuf16.h](#).

## 16.102.2 Member Function Documentation

16.102.2.1 void WriteBuffer16::SetBuffers ( K\_USHORT \* *pusData\_*, K\_USHORT *usSize\_* ) [inline]

Assign the data to be used as storage for this circular buffer.

## Parameters

<i>pusData_</i>	Pointer to the array of data to be managed as a circular buffer by this object.
<i>usSize_</i>	Size of the buffer in 16-bit elements

Definition at line 50 of file [writebuf16.h](#).

#### 16.102.2.2 void WriteBuffer16::SetCallback ( WriteBufferCallback *pfCallback\_* ) [inline]

Set the callback function to be called when the buffer hits 50% of its capacity, and again when the buffer rolls over completely.

## Parameters

<i>pfCallback_</i>	Function pointer to call whenever the buffer has reached 50% capacity, or has rolled over completely.
--------------------	---

Definition at line 69 of file [writebuf16.h](#).

#### 16.102.2.3 void WriteBuffer16::WriteData ( K\_USHORT \* *pusBuf\_*, K\_USHORT *usLen\_* )

Write an array of values to the circular buffer.

## Parameters

<i>pusBuf_</i>	Source data array to write to the circular buffer
<i>usLen_</i>	Length of the source data array in 16-bit elements

Definition at line 25 of file [writebuf16.cpp](#).

#### 16.102.2.4 void WriteBuffer16::WriteVector ( K\_USHORT \*\* *ppusBuf\_*, K\_USHORT \* *pusLen\_*, K\_UCHAR *ucCount\_* )

Write a multi-part vector to the circular buffer.

## Parameters

<i>ppusBuf_</i>	Pointer to the array of source data pointers
<i>pusLen_</i>	Array of buffer lengths
<i>ucCount_</i>	Number of source-data arrays to write to the buffer

Definition at line 37 of file [writebuf16.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/mark3-source/embedded/stage/src/writebuf16.h](#)
- [/home/moslevin/mark3-source/embedded/stage/src/writebuf16.cpp](#)

#include "ll.h"
#include "threadlist.h"
#include "thread.h"
#include "transaction.h"

```

### Classes

- class [BlockingObject](#)

*Class implementing thread-blocking primitives.*

### 17.7.1 Detailed Description

Blocking object base class declarations. A Blocking object in Mark3 is essentially a thread list. Any blocking object implementation (being a semaphore, mutex, event flag, etc.) can be built on top of this class, utilizing the provided functions to manipulate thread location within the [Kernel](#).

Blocking a thread results in that thread becoming de-scheduled, placed in the blocking object's own private list of threads which are waiting on the object.

Unblocking a thread results in the reverse: The thread is moved back to its original location from the blocking list.

The only difference between a blocking object based on this class is the logic used to determine what constitutes a Block or Unblock condition.

For instance, a semaphore Pend operation may result in a call to the Block() method with the currently-executing thread in order to make that thread wait for a semaphore Post. That operation would then invoke the Unblock() method, removing the blocking thread from the semaphore's list, and back into the appropriate thread inside the scheduler.

Care must be taken when implementing blocking objects to ensure that critical sections are used judiciously, otherwise asynchronous events like timers and interrupts could result in non-deterministic and often catastrophic behavior.

## 17.19 /home/moslevin/mark3-source/embedded/stage/src/control\_gamepanel.h File Reference

GUI Game Panel Control.

```
#include "gui.h"
#include "kerneltypes.h"
#include "draw.h"
```

### Classes

- class [GamePanelControl](#)

#### 17.19.1 Detailed Description

GUI Game Panel Control. A game panel is a blank UI element whose dimensions define the dimensions of a gameplay surface. The element triggers a draw() call on every tick event (which can be used to kick a game's state machine). The control also responds to joystick events, which can then be used to control the game.

Definition in file [control\\_gamepanel.h](#).

### Classes

- class [SlickProgressControl](#)

*Define the number of cycles that each "extended" opcode takes to execute.*

### 17.45.1 Detailed Description

Portable DCPU-16 CPU emulator. The DCPU-16 is the in-game CPU used in the upcoming game 0x10<sup>c</sup>, from the creators of the wildly successful Minecraft. While the [DCPU](#) is supposed to be part of the game, it has serious potential for use in all sorts of embedded applications.

The fact that [DCPU](#) is a very lightweight VM to implement and contains built-in instructions for accessing hardware peripherals and handling external interrupts lends itself to being used on microcontrollers.

Unlike a lot of embedded CPUs, DCPU-16 assembly is extremely simple to learn, since it has a very limited number of opcodes (37), each of which provide the same register/memory addressing modes for all operands. There are also only 2 opcode formats which make interpreting opcodes very efficient.

The DCPU-16 is extended using a variable number of "external hardware devices" which communicate with the CPU core using interrupts. These devices are enumerated on startup, and since there is no defined format for how these devices work, we can hijack this interface to provide a way for the [DCPU](#) to access resources supplied by the OS (i.e Timers, Drivers), or the hardware directly. This also lends itself to inter-VM communications (multiple DCPUs communicating with eachother in different OS threads). There's an immense amount of flexibility here - applications from debugging to scripting to runtime-configuration are all easily supported by this machine.

But what is a platform without tools support? Fortunately, the hype around 0x10c is building - and a development community for this platform has grown immensely. There are a number of compilers, assemblers, and IDEs, many of which support virtualized hardware extensions. One of the compilers is a CLANG/LLVM backend, which should allow for very good C language support.

I had attempted to do something similar by creating a VM based on the 8051 (see the Funk51 project on sourceforge), but that project was at least four times as large - and the tools support was very spotty. There were C compilers, but there was a lot of shimming required to produce output that was suitable for the VM. Also, the lack of a native host interface (interrupts, hardware bus enumerations, etc.) forced a non-standard approach to triggering native methods by writing commands to a reserved chunk of memory and writing to a special "trigger" address to invoke the native system. Using a DCPU-16 based simulator addresses this in a nice, clean way by providing modern tools, and a VM infrastructure tailored to be interfaced with a host.

Regarding this version of the [DCPU](#) emulator - it's very simple to use. Program binaries are loaded into buffers in the host CPU's RAM, with the host also providing a separate buffer for [DCPU](#) RAM. The size of the [DCPU](#) RAM buffer will contain both the RAM area, as well as the program stack, so care must be taken to ensure that the stack doesn't overflow. The [DCPU](#) specification allows for 64K words (128KB) of RAM and ROM each, but this implementation allows us to tailor the CPU for more efficient or minimal environments.

In the future, this emulator will be extended to provide a mechanism to allow programs to be run out of flash, EEPROM, or other interfaces via the Mark3 Drivers API.

Once the program has been loaded into the host's address space, the [DCPU](#) class can be initialized.

```
// Use 16-bit words for 16-bit emulator.
K_USHORT ausRAM[ RAM_SIZE ];
K_USHORT ausROM[ ROM_SIZE ];
{
    class DCPU c1MyDCPU;

    // Read program code into ausROM buffer here

    // Initialize the DCPU emulator
    c1MyDCPU.Init( ausROM, RAM_SIZE, ausROM, ROM_SIZE );
}
```

Once the emulator has been initialized, the VM can be run one opcode at a time, as in the following example.

```
while(1)
{
    c1MyCPU.RunOpcode();
}
```

To inspect the contents of the VM's registers, call the GetRegisters() method. This is useful for printing the CPU

state on a regular basis, or using the PC value to determine when to end execution, or to provide an offset for disassembling the current opcode.

```
DCPU_Registers *pstRegisters;
pstRegisters = clMyCPU.GetRegisters();
```

DCPU-16 emulator.

```
#include "kerneltypes.h"
#include "ll.h"
```

## Classes

- struct [DCPU\\_Registers](#)  
*Structure defining the [DCPU](#) hardware registers.*
- class [DCPUlogin](#)  
*Class used to provide the hardware device abstraction between the [DCPU-16](#) emulator/VM and the host system.*
- class [DCPU](#)  
*[DCPU](#) emulator, used for running code out of EEPROM, RAM, or other memory interfaces than FLASH.*

## Macros

- #define [DCPU\\_NORMAL\\_OPCODE\\_MASK](#)(x) ((K\_USHORT)(x & 0x001F))  
*[DCPU](#) v1.7 CPU emulator.*
- #define [DCPU\\_EXTENDED\\_OPCODE\\_MASK](#)(x) ((K\_USHORT)((x >> 5) & 0x001F))
- #define [DCPU\\_A\\_MASK](#)(x) ((K\_USHORT)((x >> 10) & 0x003F))
- #define [DCPU\\_B\\_MASK](#)(x) ((K\_USHORT)((x >> 5) & 0x001F))
- #define [DCPU\\_BUILD\\_NORMAL](#)(x, y, z) ( ((K\_USHORT)(x) & 0x001F) | ((K\_USHORT)(y) & 0x001F) << 5 | ((K\_USHORT)(z) & 0x003F) << 10 )
- #define [DCPU\\_BUILD\\_EXTENDED](#)(x, y) ( ((K\_USHORT)(x & 0x001F) << 5) | ((K\_USHORT)(y & 0x003F) << 10) )

## Typedefs

- typedef void(\* [DCPU\\_Callback](#) )(DCPU \*pcIVM\_)  
*Callback function type used to implement HWI for VM->Host communications.*

### 17.47.1 Detailed Description

DCPU-16 emulator.

Definition in file [dcpu.h](#).

### 17.47.2 Macro Definition Documentation

17.47.2.1 `#define DCPU_NORMAL_OPCODE_MASK( x ) ((K_USHORT)(x & 0x001F))`

[DCPU](#) v1.7 CPU emulator.

Basic opcode format: [aaaaaabbbbbbooooo]

Where: - aaaaaa 6-bit source argument

- bbbbb 5-bit destination argument
- o is the opcode itself in a

If oooo = 0, then it's an "extended" opcode

Extended opcode format: [aaaaaaoooooxxxxx]

Where:

- xxxxx = all 0's - (basic opcode)
- ooooo = an extended opcode
- aaaaaa = the argument

Definition at line 48 of file [dcpu.h](#).

### 17.47.3 Enumeration Type Documentation

17.47.3.1 enum [DCPU\\_OpBasic](#)

[DCPU](#) Basic Opcodes.

## Enumerator

**OP\_NON\_BASIC** special instruction - see below

**OP\_SET** b, a | sets b to a

**OP\_ADD** b, a | sets b to b+a, sets EX to 0x0001 if there's an overflow, 0x0 otherwise

**OP\_SUB** b, a | sets b to b-a, sets EX to 0xffff if there's an underflow, 0x0 otherwise

**OP\_MUL** b, a | sets b to b\*a, sets EX to ((b\*a)>>16)&0xffff (treats b, a as unsigned)

**OP\_MLI** b, a | like MUL, but treat b, a as signed

**OP\_DIV** b, a | sets b to b/a, sets EX to ((b<<16)/a)&0xffff. if a==0, sets b and EX to 0 instead. (treats b, a as unsigned)

**OP\_DVI** b, a | like DIV, but treat b, a as signed. Rounds towards 0

**OP\_MOD** b, a | sets b to ba. if a==0, sets b to 0 instead.

**OP\_MDI** b, a | like MOD, but treat b, a as signed. (MDI -7, 16 == -7)

**OP\_AND** b, a | sets b to b&a

**OP\_BOR** b, a | sets b to b|a

**OP\_XOR** b, a | sets b to b^a

**OP\_SHR** b, a | sets b to b>>>a, sets EX to ((b<<16)>>>a)&0xffff (logical shift)

**OP\_ASR** b, a | sets b to b>>>a, sets EX to ((b<<16)>>>a)&0xffff (arithmetic shift) (treats b as signed)

**OP\_SHL** b, a | sets b to b<<<a, sets EX to ((b<<<a)>>>16)&0xffff

**OP\_IFB** b, a | performs next instruction only if (b&a)!=0

**OP\_IFC** b, a | performs next instruction only if (b&a)==0

**OP\_IFE** b, a | performs next instruction only if b==a

**OP\_IFN** b, a | performs next instruction only if b!=a

**OP\_IFG** b, a | performs next instruction only if b>a

**OP\_IFA** b, a | performs next instruction only if b>a (signed)

**OP\_IFL** b, a | performs next instruction only if b<a

**OP\_IFU** b, a | performs next instruction only if b<a (signed)

**OP\_18** UNDEFINED

**OP\_19** UNDEFINED

**OP\_ADX** b, a | sets b to b+a+EX, sets EX to 0x0001 if there is an over-flow, 0x0 otherwise

**OP\_SBX** b, a | sets b to b-a+EX, sets EX to 0xFFFF if there is an under-flow, 0x0 otherwise

**OP\_1C** UNDEFINED

**OP\_1D** UNDEFINED

**OP\_STI** b, a | sets b to a, then increases I and J by 1

**OP\_STD** b, a | sets b to a, then decreases I and J by 1

Definition at line 99 of file [dcpu.h](#).

## 17.47.3.2 enum DCPU\_OpExtended

[DCPU](#) Extended opcodes.

## Enumerator

**OP\_EX\_JSR** a - pushes the address of the next instruction to the stack, then sets PC to a

**OP\_EX\_2** UNDEFINED

**OP\_EX\_3** UNDEFINED

**OP\_EX\_4** UNDEFINED

**OP\_EX\_5** UNDEFINED  
**OP\_EX\_6** UNDEFINED  
**OP\_EX\_7** UNDEFINED  
**OP\_EX\_INT** Invoke software interrupt "a".  
**OP\_EX\_IAG** Get interrupt address in "a".  
**OP\_EX\_IAS** Set interrupt address from "a".  
**OP\_EX\_RFI** Disables interrupt queueing, pops A from the stack, then pops PC from the stack.  
**OP\_EX\_IAQ** if a is nonzero, interrupts will be added to the queue instead of triggered. if a is zero, interrupts will be triggered as normal again  
**OP\_EX\_D** UNDEFINED  
**OP\_EX\_E** UNDEFINED  
**OP\_EX\_F** UNDEFINED  
**OP\_EX\_HWN** Sets "a" to number of connected HW devices.  
**OP\_EX\_HWQ** Set registers with information about hardware at index "a".  
**OP\_EX\_HWI** Send an interrupt to hardware interface "a".  
**OP\_EX\_13** UNDEFINED  
**OP\_EX\_14** UNDEFINED  
**OP\_EX\_15** UNDEFINED  
**OP\_EX\_16** UNDEFINED  
**OP\_EX\_17** UNDEFINED  
**OP\_EX\_18** UNDEFINED  
**OP\_EX\_19** UNDEFINED  
**OP\_EX\_1A** UNDEFINED  
**OP\_EX\_1B** UNDEFINED  
**OP\_EX\_1C** UNDEFINED  
**OP\_EX\_1D** UNDEFINED  
**OP\_EX\_1E** UNDEFINED  
**OP\_EX\_1F** UNDEFINED

### 17.49.1 Detailed Description

Hex codes/translation tables used for efficient string tokenization. We use this for efficiently encoding strings used for kernel traces, debug prints, etc. The upside - this is really fast and efficient for encoding strings and data. Downside? The tools need to parse this header file in order to convert the enumerated data into actual strings, decoding them.

Definition in file [debug\\_tokens.h](#).

## 17.51 /home/moslevin/mark3-source/embedded/stage/src/draw.h File Reference

Raster graphics APIs Description: Implements basic drawing functionality.

```

#include "kerneltypes.h"
#include "font.h"
#include "colorspace.h"

```

### Classes

- struct [DrawPoint\\_t](#)  
*Defines a pixel.*
- struct [DrawLine\\_t](#)  
*Defines a simple line.*
- struct [DrawRectangle\\_t](#)  
*Defines a rectangle.*
- struct [DrawCircle\\_t](#)  
*Defines a circle.*
- struct [DrawEllipse\\_t](#)  
*Defines a ellipse.*
- struct [DrawBitmap\\_t](#)  
*Defines a bitmap.*
- struct [DrawStamp\\_t](#)  
*Defines a 1-bit 2D bitmap of arbitrary resolution.*
- struct [DrawText\\_t](#)  
*Defines a bitmap-rendered string.*
- struct [TextFX\\_t](#)
- struct [DrawWindow\\_t](#)

*Defines the active window - establishes boundaries for drawing on the current display.*

- struct `DrawMove_t`  
*Simple 2D copy/paste.*
- struct `DrawVector_t`  
*Specifies a single 2D point.*
- struct `DrawPoly_t`  
*Defines the structure of an arbitrary polygon.*

## Macros

- #define TEXTFX\_FLAG\_OPAQUE\_BG (0x01)  
*Use an opaque BG.*
- #define TEXTFX\_FLAG\_ROTATE (0x02)  
*Apply text rotation.*
- #define TEXTFX\_FLAG\_SCALE\_X (0x04)  
*Scale the text horizontally.*
- #define TEXTFX\_FLAG\_SCALE\_Y (0x08)  
*Scale the text vertically.*

## Enumerations

- enum **DisplayEvent\_t** {  
  **DISPLAY\_EVENT\_SET\_PIXEL** = 0x00, **DISPLAY\_EVENT\_GET\_PIXEL**, **DISPLAY\_EVENT\_CLEAR**, **DISPLAY\_EVENT\_LINE**,  
  **DISPLAY\_EVENT\_RECTANGLE**, **DISPLAY\_EVENT\_CIRCLE**, **DISPLAY\_EVENT\_ELLIPSE**, **DISPLAY\_EVENT\_BITMAP**,  
  **DISPLAY\_EVENT\_STAMP**, **DISPLAY\_EVENT\_TEXT**, **DISPLAY\_EVENT\_MOVE**, **DISPLAY\_EVENT\_POLY** }

### 17.51.1 Detailed Description

**Raster graphics APIs Description:** Implements basic drawing functionality. This forms a hardware abstraction layer which requires a backend for rendering.

[Driver](#) abstraction framework.

```

#include "kerneltypes.h"
#include "mark3cfg.h"
#include "ll.h"

```

### Classes

- class [Driver](#)  
*Base device-driver class used in hardware abstraction.*
- class [DriverList](#)  
*List of [Driver](#) objects used to keep track of all device drivers in the system.*

### 17.55.1 Detailed Description

[Driver](#) abstraction framework.

### 17.55.2 Intro

This is the basis of the driver framework. In the context of Mark3, drivers don't necessarily have to be based on physical hardware peripherals. They can be used to represent algorithms (such as random number generators), files, or protocol stacks. Unlike FunkOS, where driver IO is protected automatically by a mutex, we do not use this kind of protection - we leave it up to the driver implementor to do what's right in its own context. This also frees up the driver to implement all sorts of other neat stuff, like sending messages to threads associated with the driver. Drivers are implemented as character devices, with the standard array of posix-style accessor methods for reading, writing, and general driver control.

A global driver list is provided as a convenient and minimal "filesystem" structure, in which devices can be accessed by name.

### 17.55.3 Driver Design

A device driver needs to be able to perform the following operations: -Initialize a peripheral -Start/stop a peripheral -Handle I/O control operations -Perform various read/write operations

At the end of the day, that's pretty much all a device driver has to do, and all of the functionality that needs to be presented to the developer.

We abstract all device drivers using a base-class which implements the following methods: -Start/Open -Stop/Close -Control -Read -Write

A basic driver framework and API can thus be implemented in five function calls - that's it! You could even reduce that further by handling the initialize, start, and stop operations inside the "control" operation.

### 17.55.4 Driver API

In C++, we can implement this as a class to abstract these event handlers, with virtual void functions in the base class overridden by the inherited objects.

To add and remove device drivers from the global table, we use the following methods:

```
void DriverList::Add( Driver *pclDriver_ );
void DriverList::Remove( Driver *pclDriver_ );
```

[DriverList::Add\(\)](#)/[Remove\(\)](#) takes a single arguments the pointer to the object to operate on.

Once a driver has been added to the table, drivers are opened by NAME using [DriverList::FindByName\("/dev/name"\)](#). This function returns a pointer to the specified driver if successful, or to a built in /dev/null device if the path name is invalid. After a driver is open, that pointer is used for all other driver access functions.

This abstraction is incredibly useful any peripheral or service can be accessed through a consistent set of APIs, that make it easy to substitute implementations from one platform to another. Portability is ensured, the overhead is negligible, and it emphasizes the reuse of both driver and application code as separate entities.

Consider a system with drivers for I2C, SPI, and UART peripherals - under our driver framework, an application can initialize these peripherals and write a greeting to each using the same simple API functions for all drivers:

```
pclI2C = DriverList::FindByName("/dev/i2c");
pclUART = DriverList::FindByName("/dev/tty0");
pclSPI = DriverList::FindByName("/dev/spi");

pclI2C->Write(12, "Hello World!");
pclUART->Write(12, "Hello World!");
pclSPI->Write(12, "Hello World!");
```

Definition in file [driver.h](#).

## 17.61 /home/moslevin/mark3-source/embedded/stage/src/fixed\_heap.cpp File Reference

Fixed-block-size memory management.

```

#include "kerneltypes.h"
#include "fixed_heap.h"
#include "threadport.h"

```

### 17.61.1 Detailed Description

Fixed-block-size memory management. This allows a user to create heaps containing multiple lists, each list containing a linked-list of blocks that are each the same size. As a result of the linked-list format, these heaps are very fast - requiring only a linked list pop/push to allocated/free memory. Array traversal is required to allow for the optimal heap to be used. Blocks are chosen from the first heap with free blocks large enough to fulfill the request.

Only simple malloc/free functionality is supported in this implementation, no complex vector-allocate or reallocation functions are supported.

Heaps are protected by critical section, and are thus thread-safe.

When creating a heap, a user supplies an array of heap configuration objects, which determines how many objects of what size are available.

The configuration objects are defined from smallest list to largest, the memory to back the heap is supplied as a pointer to a "blob" of memory which will be used to create the underlying heap objects that make up the heap internal data structures. This blob must be large enough to contain all of the requested heap objects, with all of the

additional metadata required to manage the objects.

Multiple heaps can be created using this library (heaps are not singleton).

    **EVENT\_TYPE\_TIMER**, **EVENT\_TYPE\_COUNT** }  
*Enumeration defining the various UI event codes.*
- enum **GuiReturn\_t** {  
    **GUI\_EVENT\_OK** = 0, **GUI\_EVENT\_CONSUMED**, **GUI\_EVENT\_CANCEL**, **GUI\_EVENT\_RETRY**,  
    **GUI\_EVENT\_COUNT** }

### 17.73.1 Detailed Description

Graphical User Interface classes and data structure declarations.

Definition in file [gui.h](#).

### 17.73.2 Enumeration Type Documentation

#### 17.73.2.1 enum **GuiEventType\_t**

Enumeration defining the various UI event codes.

##### Enumerator

- EVENT\_TYPE\_KEYBOARD** Keypress event.
- EVENT\_TYPE\_MOUSE** Mouse movement or click event.
- EVENT\_TYPE\_TOUCH** Touchscreen movement event.
- EVENT\_TYPE\_JOYSTICK** Joystick event.
- EVENT\_TYPE\_TIMER** [Timer](#) event.
- EVENT\_TYPE\_COUNT** Count of different event types supported.

Definition at line 65 of file [gui.h](#).

#### 17.73.2.2 enum **GuiReturn\_t**

##### Enumerator

- GUI\_EVENT\_OK** No problem.
- GUI\_EVENT\_CONSUMED** Event was consumed.
- GUI\_EVENT\_CANCEL** Event processing canceled.
- GUI\_EVENT\_RETRY** Retry processing the event.

Definition at line 203 of file [gui.h](#).

[Kernel](#) initialization and startup class.

```

#include "kerneltypes.h"
#include "panic_codes.h"

```

### Classes

- class [Kernel](#)

*Class that encapsulates all of the kernel startup functions.*

### 17.77.1 Detailed Description

[Kernel](#) initialization and startup class. The [Kernel](#) namespace provides functions related to initializing and starting up the kernel.

The [Kernel::Init\(\)](#) function must be called before any of the other functions in the kernel can be used.

Once the initial kernel configuration has been completed (i.e. first threads have been added to the scheduler), the [Kernel::Start\(\)](#) function can then be called, which will transition code execution from the "main()" context to the threads in the scheduler.

Definition in file [kernel.h](#).

*Basic linked-list node data structure.*
- class [LinkedList](#)  
*Abstract-data-type from which all other linked-lists are derived.*
- class [DoubleLinkedList](#)  
*Doubly-linked-list data type, inherited from the base [LinkedList](#) type.*
- class [CircularLinkedList](#)  
*Circular-linked-list data type, inherited from the base [LinkedList](#) type.*

### Macros

- `#define NULL (0)`

#### 17.103.1 Detailed Description

Core linked-list declarations, used by all kernel list types. At the heart of RTOS data structures are linked lists. Having a robust and efficient set of linked-list types that we can use as a foundation for building the rest of our kernel types allows us to keep our RTOS code efficient and logically-separated.

So what data types rely on these linked-list classes?

-Threads -ThreadLists -The [Scheduler](#) -Timers, -The [Timer Scheduler](#) -Blocking objects (Semaphores, Mutexes, etc...)

Pretty much everything in the kernel uses these linked lists. By having objects inherit from the base linked-list node type, we're able to leverage the double and circular linked-list classes to manager virtually every object type in the system without duplicating code. These functions are very efficient as well, allowing for very deterministic behavior in our code.

Definition in file [ll.h](#).

- `#define KERNEL_USE_PROFILER (1)`  
*Provides extra classes for profiling the performance of code.*
- `#define KERNEL_USE_DEBUG (0)`  
*Provides extra logic for kernel debugging, and instruments the kernel with extra asserts, and kernel trace functionality.*
- `#define KERNEL_USE_ATOMIC (1)`  
*Provides support for atomic operations, including addition, subtraction, set, and test-and-set.*
- `#define SAFE_UNLINK (1)`  
*"Safe unlinking" performs extra checks on data to make sure that there are no consistencies when performing operations on linked lists.*
- `#define TRANSACTION_QUEUE_SIZE (3)`  
*Defines the size of the kernel transaction queue.*

### 17.107.1 Detailed Description

Mark3 [Kernel](#) Configuration. This file is used to configure the kernel for your specific application in order to provide the optimal set of features for a given use case.

Since you only pay the price (code space/RAM) for the features you use, you can usually find a sweet spot between features and resource usage by picking and choosing features a-la-carte. This config file is written in an "interactive" way, in order to minimize confusion about what each option provides, and to make dependencies obvious.

Definition in file [mark3cfg.h](#).

### 17.107.2 Macro Definition Documentation

#### 17.107.2.1 `#define GLOBAL_MESSAGE_POOL_SIZE (8)`

If Messages are enabled, define the size of the default kernel message pool.

Messages can be manually added to the message pool, but this mechanism is more convenient and automatic. All message queues share their message objects from this global pool to maximize efficiency and simplify data management.

Definition at line 127 of file [mark3cfg.h](#).

#### 17.107.2.2 `#define KERNEL_TIMERS_TICKLESS (1)`

If you've opted to use the kernel timers module, you have an option as to which timer implementation to use: Tick-based or Tick-less.

Tick-based timers provide a "traditional" RTOS timer implementation based on a fixed-frequency timer interrupt. While this provides very accurate, reliable timing, it also means that the CPU is being interrupted far more often than may be necessary (as not all timer ticks result in "real work" being done).

Tick-less timers still rely on a hardware timer interrupt, but uses a dynamic expiry interval to ensure that the interrupt is only called when the next timer expires. This increases the complexity of the timer interrupt handler, but reduces the number and frequency.

Note that the CPU port ([kerneltimer.cpp](#)) must be implemented for the particular timer variant desired.

Definition at line 62 of file [mark3cfg.h](#).

#### 17.107.2.3 `#define KERNEL_USE_ATOMIC (1)`

Provides support for atomic operations, including addition, subtraction, set, and test-and-set.

Add/Sub/Set contain 8, 16, and 32-bit variants.

Definition at line 177 of file [mark3cfg.h](#).

#### 17.107.2.4 `#define KERNEL_USE_DYNAMIC_THREADS (1)`

Provide extra [Thread](#) methods to allow the application to create (and more importantly destroy) threads at runtime.

Useful for designs implementing worker threads, or threads that can be restarted after encountering error conditions.

Definition at line 159 of file [mark3cfg.h](#).

#### 17.107.2.5 `#define KERNEL_USE_EVENTFLAG (1)`

Provides additional event-flag based blocking.

This relies on an additional per-thread flag-mask to be allocated, which adds 2 bytes to the size of each thread object.

Definition at line 106 of file [mark3cfg.h](#).

#### 17.107.2.6 `#define KERNEL_USE_MESSAGE (1)`

Enable inter-thread messaging using message queues.

This is the preferred mechanism for IPC for serious multi-threaded communications; generally anywhere a semaphore or event-flag is insufficient.

Definition at line 114 of file [mark3cfg.h](#).

#### 17.107.2.7 `#define KERNEL_USE_PROFILER (1)`

Provides extra classes for profiling the performance of code.

Useful for debugging and development, but uses an additional hardware timer.

Definition at line 165 of file [mark3cfg.h](#).

#### 17.107.2.8 `#define KERNEL_USE_QUANTUM (1)`

Do you want to enable time quanta? This is useful when you want to have tasks in the same priority group share time in a controlled way.

This allows equal tasks to use unequal amounts of the CPU, which is a great way to set up CPU budgets per thread in a round-robin scheduling system. If enabled, you can specify a number of ticks that serves as the default time period (quantum). Unless otherwise specified, every thread in a priority will get the default quantum.

Definition at line 75 of file [mark3cfg.h](#).

#### 17.107.2.9 `#define KERNEL_USE_SEMAPHORE (1)`

Do you want the ability to use counting/binary semaphores for thread synchronization? Enabling this features provides fully-blocking semaphores and enables all API functions declared in [semaphore.h](#).

If you have to pick one blocking mechanism, this is the one to choose.

Definition at line 92 of file [mark3cfg.h](#).

#### 17.107.2.10 #define KERNEL\_USE\_THREADNAME (1)

Provide [Thread](#) method to allow the user to set a name for each thread in the system.

Adds a const K\_CHAR\* pointer to the size of the thread object.

Definition at line 151 of file [mark3cfg.h](#).

#### 17.107.2.11 #define KERNEL\_USE\_TIMERS (1)

The following options is related to all kernel time-tracking.

-timers provide a way for events to be periodically triggered in a lightweight manner. These can be periodic, or one-shot.

-Thread [Quantum](#) (used for round-robin scheduling) is dependent on this module, as is [Thread](#) Sleep functionality.

Definition at line 41 of file [mark3cfg.h](#).

#### 17.107.2.12 #define SAFE\_UNLINK (1)

"Safe unlinking" performs extra checks on data to make sure that there are no consistencies when performing operations on linked lists.

This goes beyond pointer checks, adding a layer of structural and metadata validation to help detect system corruption early.

Definition at line 185 of file [mark3cfg.h](#).

#### 17.107.2.13 #define THREAD\_QUANTUM\_DEFAULT (4)

This value defines the default thread quantum when KERNEL\_USE\_QUANTUM is enabled.

The thread quantum value is in milliseconds

Definition at line 84 of file [mark3cfg.h](#).

#### 17.107.2.14 #define TRANSACTION\_QUEUE\_SIZE (3)

Defines the size of the kernel transaction queue.

This defines the maximum number of queued operations that can be simultaneously pending on all blocking objects at any given time. Given that only unblocking operations from an interrupt context can necessitate a value larger than 1, this value really doesn't need to be that large.

Definition at line 194 of file [mark3cfg.h](#).

## Classes

- class [Message](#)  
*Class to provide message-based IPC services in the kernel.*
- class [GlobalMessagePool](#)  
*Implements a list of message objects shared between all threads.*
- class [MessageQueue](#)  
*List of messages, used as the channel for sending and receiving messages between threads.*

### 17.115.1 Detailed Description

Inter-thread communication via message-passing. Embedded systems guru Jack Ganssle once said that without a robust form of interprocess communications (IPC), an RTOS is just a toy. Mark3 implements a form of IPC to provide safe and flexible messaging between threads.

Using kernel-managed IPC offers significant benefits over other forms of data sharing (i.e. Global variables) in that it avoids synchronization issues and race conditions common to the practice. Using IPC also enforces a more disciplined coding style that keeps threads decoupled from one another and minimizes global data preventing careless and hard-to-debug errors.

### 17.115.2 Using Messages, Queues, and the Global Message Pool

```
// Declare a message queue shared between two threads
MessageQueue my_queue;

int main()
{
    ...
    // Initialize the message queue
    my_queue.init();
    ...
}

void Thread1()
{
    // Example TX thread - sends a message every 10ms
    while(1)
    {
        // Grab a message from the global message pool
        Message *tx_message = GlobalMessagePool::Pop();

        // Set the message data/parameters
        tx_message->SetCode( 1234 );
        tx_message->SetData( NULL );

        // Send the message on the queue.
        my_queue.Send( tx_message );
        Thread::Sleep(10);
    }
}

void Thread2()
{
    while()
    {
        // Blocking receive - wait until we have messages to process
        Message *rx_message = my_queue.Recv();

        // Do something with the message data...

        // Return back into the pool when done
        GlobalMessagePool::Push(rx_message);
    }
}
```

```
00236         Message *Receive( K_ULONG ulTimeWaitMS );
00237     #endif
00238
00247     void Send( Message *pClSrc_ );
00248

## 17.119 /home/moslevin/mark3-source/embedded/stage/src/mutex.h File Reference

Mutual exclusion class declaration.

```
#include "kerneltypes.h"
#include "mark3cfg.h"
#include "blocking.h"
#include "transaction.h"
#include "timerlist.h"
```

## Classes

- class [Mutex](#)

*Mutual-exclusion locks, based on [BlockingObject](#).*

### 17.119.1 Detailed Description

Mutual exclusion class declaration. Resource locks are implemented using mutual exclusion semaphores (Mutex\_t). Protected blocks can be placed around any resource that may only be accessed by one thread at a time. If additional threads attempt to access the protected resource, they will be placed in a wait queue until the resource becomes available. When the resource becomes available, the thread with the highest original priority claims the resource and is activated. Priority inheritance is included in the implementation to prevent priority inversion. Always ensure that you claim and release your mutex objects consistently, otherwise you may end up with a deadlock scenario that's hard to debug.

### 17.119.2 Initializing

Initializing a mutex object by calling:

```
clMutex.Init();
```

### 17.119.3 Resource protection example

```
clMutex.Claim();
...
<resource protected block>
...
clMutex.Release();
```

### 17.123.1 Detailed Description

Nice Little Filesystem ([NLFS](#)) - a simple, embeddable filesystem. Introduction to the Nice-Little-Filesystem ([NLFS](#))

[NLFS](#) is yet-another filesystem intended for use in embedded applications.

It is intended to be portable, lightweight, and flexible in terms of supporting different types of physical storage media. In order to ensure that it's easily embeddable, there are no external library dependencies, aside from library code provided elsewhere in Mark3 (namely the [MemUtil](#) utility class). Balancing code-size with features and functionality is also a tradeoff - [NLFS](#) supports basic operations (create file, create directory, read, write, seek, and delete), without a lot of other bells and whistles. One other feature built into the filesystem is posix-style user-group permissions. While the APIs in the [NLFS](#) classes do not enforce permissions explicitly, application-specific implementations of [NLFS](#) can enforce permissions based on facilities based on the security mechanisms built into the host OS.

The original purpose of this filesystem was to provide a flexible way of packaging files for read-only use within Mark3 (such as scripts and compiled DCPU-16 objects). However, there are all sorts of purposes for this type of filesystem - essentially, any application where a built-in file manifest or resource container format.

[NLFS](#) is a block-based filesystem, composed of three separate regions of data structures within a linearly-addressed blob of storage. These regions are represented on the physical storage in the following order:

[File Nodes][Data Block Headers][Block Data]

The individual regions are as follows:

#### 1) File Nodes

This region is composed of a linear array of equally-sized file-node ([NLFS\\_Node\\_t](#)) structures, starting at byte offset 0 in the underlying media.

Each node defines a particular file or directory within the filesystem. Because of the linear layout of the filesystem, the file nodes are all pre-allocated during the time of filesystem creation. As a result, care should be taken to ensure enough file nodes are allocated to meet the needs of your application, without wasting space in the filesystem for nodes that will never be needed.

The first two nodes (node 0 and node 1) are special in the [NLFS](#) implementation.

Node 0 is also known as the root filesystem node. This block contains a different internal data structure from other file nodes, and stores the configuration information for the particular filesystem, such as the number of file nodes, file blocks, block sizes, as well as indexes of the first free file and block nodes in the filesystem. With this information, it is possible to re-mount a filesystem created once in another location.

Node 1 is the mount-point for the filesystem, and is the root directory under which all other files and directories are found. By default Node 1 is simply named "/".

#### 2) Block Headers

The block header region of the system comes after the file node region, and consists of a linear array of block node data structures. All storage in a filesystem not allocated towards file nodes is automatically allocated towards data blocks, and for each data block allocated, there is a block node data structure allocated within the block node region.

The `NLFS_Block_t` data structure contains a link to the next node in a block chain. If the block is free, the link points to the index of the next free block in the filesystem. If allocated, the link points to the index of the next block in the file. This structure also contains flags which indicate whether or not a block is free or allocated, and other flags used for filesystem continuity checks.

### 3) Block Data

The block data region is the last linear range in the filesystem, and consists of equally-sized blocks in the filesystem. Each block consists of a region of raw physical storage, without any additional metadata.

The contents of any files read or written to the filesystem is stored within the blocks in this region.

The `NLFS` Class has a number of virtual methods, which require that a user provides an implementation appropriate for the underlying physical storage medium from within a class inheriting `NLFS.s`

An example implementation for a RAM-based filesystem is provided in the `NLFS_RAM` class located within `nlfs_ram.cpp`.

Definition in file `nlfs.h`.

## 17.123.2 Enumeration Type Documentation

### 17.123.2.1 enum NLFS\_Type\_t

Enumeration describing the various types of filesystem nodes used by `NLFS`.

A filesystem node is a fixed-sized data structure consisting of a type specifier, and a union of the data structures representing each possible block type.

#### Enumerator

**`NLFS_NODE_FREE`** File node is free.

**`NLFS_NODE_ROOT`** Root filesystem descriptor.

**`NLFS_NODE_FILE`** File node.

**`NLFS_NODE_DIR`** Directory node.

Definition at line 152 of file `nlfs.h`.

```

### Classes

- class [NLFS\\_File](#)  
*The [NLFS\\_File](#) class.*

### Typedefs

- typedef K\_UCHAR **NLFS\_File\_Mode\_t**

### Enumerations

- enum [NLFS\\_File\\_Mode](#) {  
    [NLFS\\_FILE\\_CREATE](#) = 0x01, [NLFS\\_FILE\\_APPEND](#) = 0x02, [NLFS\\_FILE\\_TRUNCATE](#) = 0x04, [NLFS\\_FILE\\_READ](#) = 0x08,  
    [NLFS\\_FILE\\_WRITE](#) = 0x10 }

#### 17.129.1 Detailed Description

[NLFS](#) file access class.

Definition in file [nlfs\\_file.h](#).

#### 17.129.2 Enumeration Type Documentation

##### 17.129.2.1 enum [NLFS\\_File\\_Mode](#)

###### Enumerator

- [NLFS\\_FILE\\_CREATE](#)** Create the file if it does not exist.
- [NLFS\\_FILE\\_APPEND](#)** Open to end of file.
- [NLFS\\_FILE\\_TRUNCATE](#)** Truncate file size to 0-bytes.
- [NLFS\\_FILE\\_READ](#)** Open file for read.
- [NLFS\\_FILE\\_WRITE](#)** Open file for write.

Definition at line 27 of file [nlfs\\_file.h](#).

## 17.139 /home/moslevin/mark3-source/embedded/stage/src/profile.h File Reference

High-precision profiling timers.

```

#include "kerneltypes.h"
#include "mark3cfg.h"
#include "ll.h"

```

### Classes

- class [ProfileTimer](#)

*Profiling timer.*

### 17.139.1 Detailed Description

High-precision profiling timers. Enables the profiling and instrumentation of performance-critical code. Multiple timers can be used simultaneously to enable system-wide performance metrics to be computed in a lightweight manner.

Usage:

```
ProfileTimer clMyTimer;
int i;

clMyTimer.Init();

// Profile the same block of code ten times
for (i = 0; i < 10; i++)
{
    clMyTimer.Start();
    ...
    //Block of code to profile
    ...
    clMyTimer.Stop();
}

// Get the average execution time of all iterations
ulAverageTimer = clMyTimer.GetAverage();

// Get the execution time from the last iteration
ulLastTimer = clMyTimer.GetCurrent();
```

Definition in file [profile.h](#).

## 17.157 /home/moslevin/mark3-source/embedded/stage/src/shell\_support.h File Reference

Support functions & data structures useful in implementing a shell.

```

#include "kerneltypes.h"
#include "memutil.h"

```

### Classes

- struct [Option\\_t](#)  
*Structure used to represent a command-line option with its arguments.*
- struct [CommandLine\\_t](#)  
*Structure containing multiple representations for command-line data.*
- struct [ShellCommand\\_t](#)  
*Data structure defining a lookup table correlating a command name to its handler function.*
- class [ShellSupport](#)  
*The [ShellSupport](#) class features utility functions which handle token processing, option/parameter lookup, and functions making it generally trivial to implement a lightweight custom shell.*

### Macros

- #define [MIN](#)(x, y) ( ( (x) < (y) ) ? (x) : (y) )  
*Utility macro used to return the lesser of two values/objects.*
- #define [MAX](#)(x, y) ( ( (x) > (y) ) ? (x) : (y) )  
*Utility macro used to return the greater of two values/objects.*

```

## 17.161 /home/moslevin/mark3-source/embedded/stage/src/slip.h File Reference

Serial Line IP framing code.

```

#include "kerneltypes.h"
#include "driver.h"

```

### Classes

- struct [SlipDataVector](#)  
*Data structure used for vector-based SLIP data transmission.*
- class [Slip](#)  
*Object used to frame communications over an abstract device using the serial-line internet protocol (SLIP).*

### Enumerations

- enum [SlipChannel](#) {  
[SLIP\\_CHANNEL\\_TERMINAL](#) = 0, [SLIP\\_CHANNEL\\_UNISCOPE](#), [SLIP\\_CHANNEL\\_NVM](#), [SLIP\\_CHANNEL\\_RESET](#),  
[SLIP\\_CHANNEL\\_GRAPHICS](#), [SLIP\\_CHANNEL\\_HID](#), [SLIP\\_CHANNEL\\_COUNT](#) }

#### 17.161.1 Detailed Description

Serial Line IP framing code. Also includes code to frame data in FunkenSlip format for use with [SlipTerm](#) on a host PC.

FunkenSlip uses SLIP-framed messages with a pre-defined packet format as follows:

[ Channel ][ Size ][ Data Buffer ][ CRC8 ]

Channel is 1 byte, indicating the type of data carried in the message

Size is 2 bytes, indicating the length of the binary blob that follows

Data Buffer is n bytes, and contains the raw packet data.

CRC16 is 2 byte, Providing an error detection mechanism

Definition in file [slip.h](#).

#### 17.161.2 Enumeration Type Documentation

##### 17.161.2.1 enum SlipChannel

##### Enumerator

- [SLIP\\_CHANNEL\\_TERMINAL](#)** ASCII text mode terminal.
- [SLIP\\_CHANNEL\\_UNISCOPE](#)** Uniscope VM command channel.
- [SLIP\\_CHANNEL\\_NVM](#)** Non-volatile memory configuration.

**SLIP\_CHANNEL\_RESET** Channel used to reset the device...

**SLIP\_CHANNEL\_GRAPHICS** Encoded drawing commands.

**SLIP\_CHANNEL\_HID** HID commands.

Definition at line 41 of file [slip.h](#).

### 17.175.1 Detailed Description

System heap configuration - defines the block sizes and counts used to fulfill system/service allocations.

Definition in file [system\\_heap\\_config.h](#).

### 17.175.2 Macro Definition Documentation

#### 17.175.2.1 `#define HEAP_BLOCK_SIZE_1 ((K_USHORT) 8)`

Define the block sizes for each of the fixed-size blocks that will be managed by our heaps.

Must be defined in incrementing order.

Definition at line 44 of file [system\\_heap\\_config.h](#).

### 17.187.1 Detailed Description

ATMega328p Multithreading support.

Definition in file [threadport.h](#).

### 17.187.2 Macro Definition Documentation

#### 17.187.2.1 #define CS\_ENTER( )

**Value:**

```
{ \
volatile K_UCHAR x; \
x = _SFR_IO8(SR_); \
ASM("cli");
```

These macros *must* be used in pairs !

Enter critical section (copy status register, disable interrupts)

Definition at line 142 of file [threadport.h](#).

#### 17.187.2.2 #define CS\_EXIT( )

**Value:**

```
_SFR_IO8(SR_) = x;\
}
```

Exit critical section (restore status register)

Definition at line 149 of file [threadport.h](#).

## 17.191 /home/moslevin/mark3-source/embedded/stage/src/timerlist.h File Reference

[Timer](#) list and timer-scheduling declarations.

```

#include "kerneltypes.h"
#include "mark3cfg.h"
#include "ll.h"

```

### Classes

- class [Timer](#)  
*Timer* - an event-driven execution context based on a specified time interval.
- class [TimerList](#)  
*TimerList* class - a doubly-linked-list of timer objects.
- class [TimerScheduler](#)  
"Static" Class used to interface a global [TimerList](#) with the rest of the kernel.

### Macros

- #define [TIMERLIST\\_FLAG\\_ONE\\_SHOT](#) (0x01)  
*Timer* is one-shot.
- #define [TIMERLIST\\_FLAG\\_ACTIVE](#) (0x02)  
*Timer* is currently active.
- #define [TIMERLIST\\_FLAG\\_CALLBACK](#) (0x04)  
*Timer* is pending a callback.
- #define [TIMERLIST\\_FLAG\\_EXPIRED](#) (0x08)  
*Timer* is actually expired.
- #define [MAX\\_TIMER\\_TICKS](#) (0x7FFFFFFF)  
Maximum value to set.
- #define [SECONDS\\_TO\\_TICKS](#)(x) (((K\_ULONG)x) \* TIMER\_FREQ)
- #define [MSECONDS\\_TO\\_TICKS](#)(x) (((((K\_ULONG)x) \* (TIMER\_FREQ/100)) + 5) / 10))
- #define [USECONDS\\_TO\\_TICKS](#)(x) (((((K\_ULONG)x) \* TIMER\_FREQ) + 50000) / 1000000))
- #define [MIN\\_TICKS](#) (3)  
The minimum tick value to set.

### Typedefs

- typedef void(\* [TimerCallback\\_t](#))([Thread](#) \*pclOwner\_, void \*pvData\_)

### 17.191.1 Detailed Description

[Timer](#) list and timer-scheduling declarations. These classes implements a linked list of timer objects attached to the global kernel timer. Unlike other kernels which use a fully-synchronous "tick-based" timing mechanism, where the OS timing facilities are based on a fixed-frequency timer (which causes regular timer interrupts), Mark3 uses a "tickless" timer implementation, which only triggers interrupts when absolutely required. This is much more efficient in most cases - timer interrupts occur less frequently, allowing the kernel to stay in sleep much longer than it would otherwise.

Definition in file [timerlist.h](#).

### 17.191.2 Macro Definition Documentation

#### 17.191.2.1 #define TIMERLIST\_FLAG\_EXPIRED (0x08)

[Timer](#) is actually expired.

Definition at line 45 of file [timerlist.h](#).

## 17.195 /home/moslevin/mark3-source/embedded/stage/src/tracebuffer.h File Reference

[Kernel](#) trace buffer class declaration.

```

#include "kerneltypes.h"
#include "mark3cfg.h"
#include "writebuf16.h"

```

### 17.195.1 Detailed Description

[Kernel](#) trace buffer class declaration. Global kernel trace-buffer. Used to instrument the kernel with lightweight encoded print statements. If something goes wrong, the tracebuffer can be examined for debugging purposes. Also, subsets of kernel trace information can be extracted and analyzed to provide information about runtime performance, thread-scheduling, and other nifty things in real-time.

Definition in file [tracebuffer.h](#).

## 17.207 /home/moslevin/mark3-source/embedded/stage/src/writebuf16.h File Reference

Thread-safe circular buffer implementation with 16-bit elements.

```
#include "kerneltypes.h"
```

### Classes

- class [WriteBuffer16](#)

*This class is used to provide a general-purpose, fully thread-safe circular buffer implementation which can be used for creating tracebuffers, data logging queues, transaction queues, etc.*

### Typedefs

- typedef void(\* [WriteBufferCallback](#) )(K\_USHORT \*pusData\_, K\_USHORT usSize\_)

*Function pointer type used to define a callback handler for when the circular buffer reaches 50% capacity..*

### 17.207.1 Detailed Description

Thread-safe circular buffer implementation with 16-bit elements.

Definition in file [writebuf16.h](#).

## 17.208 writebuf16.h
