Contents

1	The Mark3 Realtime Kernel	1
2	Preface	3
2.1	Who should read this	3
2.2	Why Mark3?	3
3	Can you Afford an RTOS?	5
3.1	Intro	5
3.2	Memory overhead:	6
3.3	Code Space Overhead:	7
3.4	Runtime Overhead	7
4	Superloops	9
4.1	Intro to Superloops	9
4.2	The simplest loop	9
4.3	Interrupt-Driven Super-loop	10
4.4	Cooperative multi-tasking	11
4.5	Hybrid cooperative/preemptive multi-tasking	12
4.6	Problems with superloops	13
5	Mark3 Overview	15
5.1	Intro	15
5.2	Features	15
5.3	Design Goals	16
6	Getting Started	17
6.1	Kernel Setup	17
6.2	Threads	18
6.2.1	Thread Setup	18
6.2.2	Entry Functions	19
6.3	Timers	19
6.4	Semaphores	20
6.5	Mutexes	21

6.6	Messages	21
6.6.1	Message Objects	22
6.6.2	Global Message Pool	22
6.6.3	Message Queues	22
6.6.4	Messaging Example	22
6.7	Sleep	23
6.8	Round-Robin Quantum	23
7	Build System	25
7.1	Source Layout	25
7.2	Building the kernel	25
7.3	Building on Windows	26
8	License	29
8.1	License	29
9	Profiling Results	31
9.1	Date Performed	31
9.2	Compiler Information	31
9.3	Profiling Results	31
10	Hierarchical Index	33
10.1	Class Hierarchy	33
11	Class Index	35
11.1	Class List	35
12	File Index	39
12.1	File List	39
13	Class Documentation	43
13.1	BlockHeap Class Reference	43
13.1.1	Detailed Description	43
13.1.2	Member Function Documentation	44
13.1.2.1	Alloc	44
13.1.2.2	Create	44
13.1.2.3	Free	44
13.1.2.4	IsFree	44
13.2	BlockingObject Class Reference	45
13.2.1	Detailed Description	45
13.2.2	Member Function Documentation	45
13.2.2.1	Block	45
13.2.2.2	UnBlock	45

13.3 ButtonControl Class Reference	46
13.3.1 Detailed Description	47
13.3.2 Member Function Documentation	47
13.3.2.1 Activate	47
13.3.2.2 Draw	47
13.3.2.3 Init	47
13.3.2.4 ProcessEvent	47
13.4 CheckBoxControl Class Reference	48
13.4.1 Detailed Description	48
13.4.2 Member Function Documentation	49
13.4.2.1 Activate	49
13.4.2.2 Draw	49
13.4.2.3 Init	49
13.4.2.4 ProcessEvent	49
13.5 CircularLinkedList Class Reference	49
13.5.1 Detailed Description	50
13.5.2 Member Function Documentation	50
13.5.2.1 Add	50
13.5.2.2 Remove	50
13.6 CommandLine_t Struct Reference	51
13.6.1 Detailed Description	51
13.7 DCPU Class Reference	51
13.7.1 Detailed Description	53
13.7.2 Member Function Documentation	53
13.7.2.1 AddPlugin	53
13.7.2.2 GetOperand	53
13.7.2.3 GetRegisters	53
13.7.2.4 HWN	54
13.7.2.5 IAQ	54
13.7.2.6 Init	54
13.7.2.7 RFI	54
13.7.2.8 SendInterrupt	54
13.7.3 Member Data Documentation	54
13.7.3.1 m_clPluginList	54
13.8 DCPU_Registers Struct Reference	55
13.8.1 Detailed Description	55
13.9 DCPUPlugin Class Reference	55
13.9.1 Detailed Description	56
13.9.2 Member Function Documentation	56
13.9.2.1 Enumerate	56

13.9.2.2	GetDeviceNumber	57
13.9.2.3	Init	57
13.9.2.4	Interrupt	57
13.10	DevNull Class Reference	57
13.10.1	Detailed Description	58
13.10.2	Member Function Documentation	58
13.10.2.1	Close	58
13.10.2.2	Control	58
13.10.2.3	Open	59
13.10.2.4	Read	59
13.10.2.5	Write	59
13.11	DoubleLinkedList Class Reference	60
13.11.1	Detailed Description	60
13.11.2	Member Function Documentation	60
13.11.2.1	Add	60
13.11.2.2	Remove	61
13.12	DrawBitmap_t Struct Reference	61
13.12.1	Detailed Description	61
13.13	DrawCircle_t Struct Reference	61
13.13.1	Detailed Description	62
13.14	DrawEllipse_t Struct Reference	62
13.14.1	Detailed Description	62
13.15	DrawLine_t Struct Reference	63
13.15.1	Detailed Description	63
13.16	DrawMove_t Struct Reference	63
13.16.1	Detailed Description	64
13.17	DrawPoint_t Struct Reference	64
13.17.1	Detailed Description	64
13.18	DrawPoly_t Struct Reference	64
13.18.1	Detailed Description	65
13.19	DrawRectangle_t Struct Reference	65
13.19.1	Detailed Description	65
13.20	DrawStamp_t Struct Reference	65
13.20.1	Detailed Description	66
13.21	DrawText_t Struct Reference	66
13.21.1	Detailed Description	66
13.22	DrawVector_t Struct Reference	67
13.22.1	Detailed Description	67
13.23	DrawWindow_t Struct Reference	67
13.23.1	Detailed Description	67

13.24Driver Class Reference	68
13.24.1 Detailed Description	68
13.24.2 Member Function Documentation	69
13.24.2.1 Close	69
13.24.2.2 Control	69
13.24.2.3 GetPath	69
13.24.2.4 Open	69
13.24.2.5 Read	70
13.24.2.6 SetName	70
13.24.2.7 Write	70
13.25DriverList Class Reference	70
13.25.1 Detailed Description	71
13.25.2 Member Function Documentation	71
13.25.2.1 Add	71
13.25.2.2 FindByPath	71
13.25.2.3 Init	71
13.25.2.4 Remove	72
13.26FixedHeap Class Reference	72
13.26.1 Detailed Description	72
13.26.2 Member Function Documentation	72
13.26.2.1 Alloc	72
13.26.2.2 Create	73
13.26.2.3 Free	73
13.27Font_t Struct Reference	73
13.27.1 Detailed Description	74
13.28GamePanelControl Class Reference	74
13.28.1 Detailed Description	74
13.28.2 Member Function Documentation	74
13.28.2.1 Activate	74
13.28.2.2 Draw	75
13.28.2.3 Init	75
13.28.2.4 ProcessEvent	75
13.29GlobalMessagePool Class Reference	75
13.29.1 Detailed Description	76
13.29.2 Member Function Documentation	76
13.29.2.1 Pop	76
13.29.2.2 Push	76
13.30Glyph_t Struct Reference	76
13.30.1 Detailed Description	77
13.31GraphicsDriver Class Reference	77

13.31.1 Detailed Description	78
13.31.2 Member Function Documentation	78
13.31.2.1 Bitmap	78
13.31.2.2 Circle	78
13.31.2.3 DrawPixel	79
13.31.2.4 Ellipse	79
13.31.2.5 Line	79
13.31.2.6 Move	79
13.31.2.7 Point	79
13.31.2.8 ReadPixel	79
13.31.2.9 Rectangle	80
13.31.2.10 SetWindow	80
13.31.2.11 Stamp	80
13.31.2.12 Text	80
13.31.2.13 TriangleFill	80
13.31.2.14 TriangleWire	81
13.32 GroupBoxControl Class Reference	81
13.32.1 Detailed Description	82
13.32.2 Member Function Documentation	82
13.32.2.1 Activate	82
13.32.2.2 Draw	82
13.32.2.3 Init	82
13.32.2.4 ProcessEvent	82
13.33 GuiControl Class Reference	83
13.33.1 Detailed Description	85
13.33.2 Member Function Documentation	85
13.33.2.1 Activate	85
13.33.2.2 ClearStale	85
13.33.2.3 Draw	86
13.33.2.4 GetControllIndex	86
13.33.2.5 GetControlOffset	86
13.33.2.6 GetHeight	86
13.33.2.7 GetLeft	86
13.33.2.8 GetParentControl	86
13.33.2.9 GetParentWindow	87
13.33.2.10 GetTop	87
13.33.2.11 GetWidth	87
13.33.2.12 GetZOrder	87
13.33.2.13 Init	87
13.33.2.14 IsInFocus	88

13.33.2.15	IsStale	88
13.33.2.16	ProcessEvent	88
13.33.2.17	SetControlIndex	88
13.33.2.18	SetHeight	88
13.33.2.19	SetLeft	89
13.33.2.20	SetParentControl	89
13.33.2.21	SetParentWindow	89
13.33.2.22	SetTop	89
13.33.2.23	SetWidth	89
13.33.2.24	SetZOrder	90
13.33.3	Member Data Documentation	90
13.33.3.1	m_ucControlIndex	90
13.33.3.2	m_ucZOrder	90
13.34	GuiEvent_t Struct Reference	90
13.34.1	Detailed Description	91
13.35	GuiEventSurface Class Reference	91
13.35.1	Detailed Description	92
13.35.2	Member Function Documentation	92
13.35.2.1	AddWindow	92
13.35.2.2	CopyEvent	92
13.35.2.3	Init	92
13.35.2.4	InvalidateRegion	92
13.35.2.5	ProcessEvent	92
13.35.2.6	RemoveWindow	93
13.35.2.7	SendEvent	93
13.36	GuiWindow Class Reference	93
13.36.1	Detailed Description	95
13.36.2	Member Function Documentation	95
13.36.2.1	AddControl	95
13.36.2.2	CycleFocus	95
13.36.2.3	GetDriver	96
13.36.2.4	GetHeight	96
13.36.2.5	GetLeft	96
13.36.2.6	GetMaxZOrder	96
13.36.2.7	GetTop	96
13.36.2.8	GetWidth	96
13.36.2.9	Init	97
13.36.2.10	InvalidateRegion	97
13.36.2.11	IsInFocus	97
13.36.2.12	ProcessEvent	97

13.36.2.13	Redraw	97
13.36.2.14	RemoveControl	97
13.36.2.15	SetDriver	98
13.36.2.16	SetFocus	98
13.36.2.17	SetHeight	98
13.36.2.18	SetLeft	98
13.36.2.19	SetTop	98
13.36.2.20	SetWidth	98
13.36.3	Member Data Documentation	99
13.36.3.1	m_pclDriver	99
13.37	HeapConfig Class Reference	99
13.37.1	Detailed Description	99
13.38	JoystickEvent_t Struct Reference	100
13.38.1	Detailed Description	100
13.39	Kernel Class Reference	101
13.39.1	Detailed Description	101
13.39.2	Member Function Documentation	101
13.39.2.1	Init	101
13.39.2.2	IsPanic	101
13.39.2.3	IsStarted	102
13.39.2.4	Panic	102
13.39.2.5	SetPanic	102
13.39.2.6	Start	102
13.40	KernelSWI Class Reference	102
13.40.1	Detailed Description	103
13.40.2	Member Function Documentation	103
13.40.2.1	DI	103
13.40.2.2	RI	103
13.41	KernelTimer Class Reference	104
13.41.1	Detailed Description	104
13.41.2	Member Function Documentation	104
13.41.2.1	GetOvertime	104
13.41.2.2	Read	105
13.41.2.3	RI	105
13.41.2.4	SetExpiry	105
13.41.2.5	SubtractExpiry	105
13.41.2.6	TimeToExpiry	105
13.42	KeyEvent_t Struct Reference	106
13.42.1	Detailed Description	106
13.43	LabelControl Class Reference	106

13.43.1 Detailed Description	107
13.43.2 Member Function Documentation	107
13.43.2.1 Activate	107
13.43.2.2 Draw	108
13.43.2.3 Init	108
13.43.2.4 ProcessEvent	108
13.44 LinkList Class Reference	108
13.44.1 Detailed Description	109
13.44.2 Member Function Documentation	109
13.44.2.1 Add	109
13.44.2.2 GetHead	109
13.44.2.3 GetTail	109
13.44.2.4 Remove	110
13.45 LinkListNode Class Reference	110
13.45.1 Detailed Description	111
13.45.2 Member Function Documentation	111
13.45.2.1 GetNext	111
13.45.2.2 GetPrev	111
13.46 MemUtil Class Reference	111
13.46.1 Detailed Description	112
13.46.2 Member Function Documentation	112
13.46.2.1 Checksum16	112
13.46.2.2 Checksum8	113
13.46.2.3 CompareMemory	113
13.46.2.4 CompareStrings	113
13.46.2.5 CopyMemory	113
13.46.2.6 CopyString	114
13.46.2.7 DecimalToHex	114
13.46.2.8 DecimalToString	114
13.46.2.9 SetMemory	114
13.46.2.10 StringLength	115
13.46.2.11 StringSearch	115
13.46.2.12 Tokenize	115
13.47 Message Class Reference	115
13.47.1 Detailed Description	116
13.47.2 Member Function Documentation	116
13.47.2.1 GetCode	116
13.47.2.2 GetData	117
13.47.2.3 SetCode	117
13.47.2.4 SetData	117

13.48	MessageQueue Class Reference	117
13.48.1	Detailed Description	118
13.48.2	Member Function Documentation	118
13.48.2.1	GetCount	118
13.48.2.2	Receive	118
13.48.2.3	Receive	118
13.48.2.4	Send	119
13.49	MouseEvent_t Struct Reference	119
13.49.1	Detailed Description	119
13.50	Mutex Class Reference	120
13.50.1	Detailed Description	120
13.50.2	Member Function Documentation	121
13.50.2.1	Claim	121
13.50.2.2	Claim	121
13.50.2.3	Release	121
13.50.2.4	SetExpired	121
13.50.2.5	WakeMe	121
13.51	NLFS Class Reference	122
13.51.1	Detailed Description	124
13.51.2	Member Function Documentation	124
13.51.2.1	Append_Block_To_Node	124
13.51.2.2	Cleanup_Node_Links	124

Chapter 1

The Mark3 Realtime Kernel

--[Mark3 Realtime Platform]-----

Copyright (c) 2012-2013 Funkenstein Software Consulting, all rights reserved.
See license.txt for more information

The Mark3 Realtime [Kernel](#) is a completely free, open-source, real-time operating system aimed at bringing multi-tasking to microcontroller systems without MMUs.

It uses modern programming languages and concepts (it's written entirely in C++) to minimize code duplication, and its object-oriented design enhances readability. The API is simple - there are only six functions required to set up the kernel, initialize threads, and start the scheduler.

The source is fully-documented with example code provided to illustrate concepts. The result is a performant RTOS, which is easy to read, easy to understand, and easy to extend to fit your needs.

But Mark3 is bigger than just a real-time kernel, it also contains a number of class-leading features:

- Device driver HAL which provides a meaningful abstraction around device-specific peripherals.
- Capable recursive-make driven build system which can be used to build all libraries, examples, tests, and documentation for any number of targets from the command-line.
- Graphics and UI code designed to simplify the implementation of systems using displays, keypads, joysticks, and touchscreens
- Standards-based custom communications protocol used to simplify the creation of host tools
- A bulletproof, well-documented bootloader for AVR microcontrollers

Chapter 2

Preface

2.1 Who should read this

As the cover clearly states, this is a book about the Mark3 real-time kernel. I assume that if you're reading this book you have an interest in some, if not all, of the following subjects:

- Embedded systems
- Real-time systems
- Operating system kernel design

And if you're interested in those topics, you're likely familiar with C and C++ and the more you know, the easier you'll find this book to read. And if C++ scares you, and you don't like embedded, real-time systems, you're probably looking for another book. If you're unfamiliar with RTOS fundamentals, I highly suggest searching through the vast amount of RTOS-related articles on the internet to familiarize yourself with the concepts.

2.2 Why Mark3?

My first job after graduating from university in 2005 was with a small company that had a very old-school, low-budget philosophy when it came to software development. Every make-or-buy decision ended with "make" when it came to tools. It was the kind of environment where vendors cost us money, but manpower was free. In retrospect, we didn't have a ton of business during the time that I worked there, and that may have had something to do with the fact that we were constantly short on ready cash for things we could code ourselves.

Early on, I asked why we didn't use industry-standard tools - like JTAG debuggers or IDEs. One senior engineer scoffed that debuggers were tools for wimps - and something that a good programmer should be able to do without. After all - we had serial ports, GPIOs, and a bi-color LED on our boards. Since these were built into the hardware, they didn't cost us a thing. We also had a single software "build" server that took 5 minutes to build a 32k binary on its best days, so when we had to debug code, it was a painful process of trial and error, with lots of Youtube between iterations. We complained that tens of thousands of dollars of productivity was being flushed away that could have been solved by implementing a proper build server - and while we eventually got our wish, it took far more time than it should have.

Needless to say, software development was painful at that company. We made life hard on ourselves purely out of pride, and for the right to say that we walked "up-hills both ways through 3 feet of snow, everyday". Our code was tied ever-so-tightly to our hardware platform, and the system code was indistinguishable from the application. While we didn't use an RTOS, we had effectively implemented a 3-priority threading scheme using a carefully designed interrupt nesting scheme with event flags and a while(1) superloop running as a background thread. Nothing was abstracted, and the code was always optimized for the platform, presumably in an effort to save on code size and wasted cycles. I asked why we didn't use an RTOS in any of our systems and received dismissive scoffs - the overhead from thread switching and maintaining multiple threads could not be tolerated in our systems according

to our chief engineers. In retrospect, our ad-hoc system was likely as large as my smallest kernel, and had just as much context switching (although it was hidden by the compiler).

And every time a new iteration of our product was developed, the firmware took far too long to bring up, because the algorithms and data structures had to be re-tooled to work with the peripherals and sensors attached to the new boards. We worked very hard in an attempt to reinvent the wheel, all in the name of producing "efficient" code.

Regardless, I learned a lot about software development.

Most important, I learned that good design is the key to good software; and good design doesn't have to come at a price. In all but the smallest of projects, the well-designed, well-abstracted code is not only more portable, but it's usually smaller, easier to read, and easier to reuse.

Also, since we had all the time in the world to invest in developing our own tools, I gained a lot of experience building them, and making use of good, free PC tools that could be used to develop and debug a large portion of our code. I ended up writing PC-based device and peripheral simulators, state-machine frameworks, and abstractions for our horrible ad-hoc system code. At the end of the day, I had developed enough tools that I could solve a lot of our development problems without having to re-inventing the wheel at each turn. Gaining a background in how these tools worked gave me a better understanding of how to use them - making me more productive at the jobs that I've had since.

I am convinced that designing good software takes honest effort up-front, and that good application code cannot be written unless it is based on a solid framework. Just as the wise man builds his house on rocks, and not on sand, wise developers write applications based on a well-defined platforms. And while you can probably build a house using nothing but a hammer and sheer will, you can certainly build one a lot faster with all the right tools.

This conviction lead me to development my first RTOS kernel in 2009 - FunkOS. It is a small, yet surprisingly full-featured kernel. It has all the basics (semaphores, mutexes, round-robin and preemptive scheduling), and some pretty advanced features as well (device drivers and other middleware). However, it had two major problems - it doesn't scale well, and it doesn't support many devices.

While I had modest success with this kernel (it has been featured on some blogs, and still gets around 125 downloads a month), it was nothing like the success of other RTOS kernels like uC/OS-II and FreeRTOS. To be honest, as a one-man show, I just don't have the resources to support all of the devices, toolchains, and evaluation boards that a real vendor can. I had never expected my kernel to compete with the likes of them, and I don't expect Mark3 to change the embedded landscape either.

My main goal with Mark3 was to solve the technical shortfalls in the FunkOS kernel by applying my experience in kernel development. As a result, Mark3 is better than FunkOS in almost every way; it scales better, has lower interrupt latency, and is generally more thoughtfully designed (all at a small cost to code size).

Another goal I had was to create something easy to understand, that could be documented and serve as a good introduction to RTOS kernel design. The end result of these goals is the kernel as presented in this book - a full source listing of a working OS kernel, with each module completely documented and explained in detail.

Finally, I wanted to prove that a kernel written entirely in C++ could perform just as well as one written in C, without incurring any extra overhead. Comparing the same configuration of Mark2 to Mark3, the code size is remarkably similar, and the execution performance is just as good. Not only that, but there are fewer lines of code. The code is more readable and easier to understand as a result of making use of object-oriented concepts provided by C++. Applications are easier to write because common concepts are encapsulated into objects (Threads, Semaphores, Mutexes, etc.) with their own methods and data, as opposed to APIs which rely on lots of explicit pointer-passing, type casting, and other operations that are typically considered "unsafe" or "advanced topics" in C.

Chapter 3

Can you Afford an RTOS?

Of course, since you're reading the manual for an RTOS that I've been developing for the last few years, you can guess that the conclusion that I draw is a resounding "yes".

If your code is of any sort of non-trivial complexity (say, at least a few-thousand lines), then a more appropriate question would be "can you afford *not* to use an RTOS in your system?".

In short, there are simply too many benefits of an RTOS to ignore.

- Sophisticated synchronization objects
- The ability to efficiently block and wait
- Enhanced responsiveness for high-priority tasks
- Built in timers
- Built in efficient memory management

Sure, these features have a cost in code space and RAM, but from my experience the cost of trying to code around a lack of these features will cost you as much - if not more. The results are often far less maintainable, error prone, and complex. And that simply adds time and cost. Real developers ship, and the RTOS is quickly becoming one of the standard tools that help keep developers shipping.

3.1 Intro

(Note - this article was written for the C-based Mark2 kernel, which is slightly different. While the general principles are the same, the numbers are not an 100% accurate reflection of the current costs of the Mark3 kernel.)

One of the main arguments against using an RTOS in an embedded project is that the overhead incurred is too great to be justified. Concerns over "wasted" RAM caused by using multiple stacks, added CPU utilization, and the "large" code footprint from the kernel cause a large number of developers to shun using a preemptive RTOS, instead favoring a non-preemptive, application-specific solution.

I believe that not only is the impact negligible in most cases, but that the benefits of writing an application with an RTOS can lead to savings around the board (code size, quality, reliability, and development time). While these other benefits provide the most compelling case for using an RTOS, they are far more challenging to demonstrate in a quantitative way, and are clearly documented in numerous industry-based case studies.

While there is some overhead associated with an RTOS, the typical arguments are largely unfounded when an RTOS is correctly implemented in a system. By measuring the true overhead of a preemptive RTOS in a typical application, we will demonstrate that the impact to code space, RAM, and CPU usage is minimal, and indeed acceptable for a wide range of CPU targets.

To illustrate just how little an RTOS impacts the size of an embedded software design we will look at a typical microcontroller project and analyze the various types of overhead associated with using a pre-emptive realtime kernel versus a similar non-preemptive event-based framework.

RTOS overhead can be broken into three distinct areas:

- Code space: The amount of code space eaten up by the kernel (static)
- Memory overhead: The RAM associated with running the kernel and application threads.
- Runtime overhead: The CPU cycles required for the kernel's functionality (primarily scheduling and thread switching)

While there are other notable reasons to include or avoid the use of an RTOS in certain applications (determinism, responsiveness, and interrupt latency among others), these are not considered in this discussion - as they are difficult to consider for the scope of our "canned" application. Application description:

For the purpose of this comparison, we first create an application using the standard preemptive Mark3 kernel with 2 system threads running: A foreground thread and a background thread. This gives three total priority levels in the system - the interrupt level (high), and two application priority threads (medium and low), which is quite a common paradigm for microcontroller firmware designs. The foreground thread processes a variety of time-critical events at a fixed frequency, while the background thread processes lower priority, aperiodic events. When there are no background thread events to process, the processor enters its low-power mode until the next interrupt is acknowledged.

The contents of the threads themselves are unimportant for this comparison, but we can assume they perform a variety of I/O using various user-input devices and a serial graphics display. As a result, a number of Mark3 device drivers are also implemented.

The application is compiled for an ATmega328p processor which contains 32kB of code space in flash, and 2kB of RAM, which is a lower-mid-range microcontroller in Atmel's 8-bit AVR line of microcontrollers. Using the WinAVR GCC compiler with -O2 level optimizations, an executable is produced with the following code/RAM utilization:

31600 Bytes Code Space 2014 Bytes RAM

An alternate version of this project is created using a custom "super-loop" kernel, which uses a single application thread and provides 2 levels of priority (interrupt and application). In this case, the event handler processes the different priority application events to completion from highest to lowest priority.

This approach leaves the application itself largely unchanged. Using the same optimization levels as the preemptive kernel, the code compiles as follows:

29904 Bytes Code Space 1648 Bytes RAM

3.2 Memory overhead:

At first glance, the difference in RAM utilization seems quite a lot higher for the preemptive mode version of the application, but the raw numbers don't tell the whole story.

The first issue is that the cooperative-mode total does not take into account the system stack - whereas these values are included in the totals for RTOS version of the project. As a result, some further analysis is required to determine how the stack sizes truly compare.

In cooperative mode, there is only one thread of execution - so considering that multiple event handlers are executed in turn, the stack requirements for cooperative mode is simply determined by those of the most stack-intensive event handler.

In contrast, the preemptive kernel requires a separate stack for each active thread, and as a result the stack usage of the system is the sum of the stacks for all threads.

Since the application and idle events are the same for both preemptive and cooperative mode, we know that their (independent) stack requirements will be the same in both cases.

For cooperative mode, we see that the idle thread stack utilization is lower than that of the application thread, and so the application thread's determines the stack size requirement. Again, with the preemptive kernel the stack utilization is the sum of the stacks defined for both threads.

As a result, the difference in overhead between the two cases becomes the extra stack required for the idle thread - which in our case is (a somewhat generous) 64 bytes.

The numbers still don't add up completely, but looking into the linker output we see that the rest of the difference comes from the extra data structures used to declare the threads in preemptive mode.

With this taken into account, the true memory cost of a 2-thread system ends up being around 150 bytes of RAM - which is less than 8% of the total memory available on this particular microcontroller. Whether or not this is reasonable certainly depends on the application, but more importantly, it is not so unreasonable as to eliminate an RTOS-based solution from being considered.

3.3 Code Space Overhead:

The difference in code space overhead between the preemptive and cooperative mode solutions is less of an issue. Part of this reason is that both the preemptive and cooperative kernels are relatively small, and even an average target device (like the Atmega328 we've chosen) has plenty of room.

Mark3 can be configured so that only features necessary for the application are included in the RTOS - you only pay for the parts of the system that you use. In this way, we can measure the overhead on a feature-by-feature basis, which is shown below for the kernel as configured for this application:

3466 Bytes

The configuration tested in this comparison uses the thread/port module with timers, drivers, and semaphores, for a total kernel size of ~3.5KB, with the rest of the code space occupied by the application.

The custom cooperative-mode framework has a similar structure which is broken down by module as follows:

1850 Bytes

As can be seen from the compiler's output, the difference in code space between the two versions of the application is about 1.7kB - or about 5% of the available code space on the selected processor. While nearly all of this comes from the added overhead of the kernel, the rest of the difference comes the changes to the application necessary to facilitate the different frameworks.

3.4 Runtime Overhead

On the cooperative kernel, the overhead associated with running the thread is the time it takes the kernel to notice a pending event flag and launch the appropriate event handler, plus the timer interrupt execution time.

Similarly, on the preemptive kernel, the overhead is the time it takes to switch contexts to the application thread, plus the timer interrupt execution time.

The timer interrupt overhead is similar for both cases, so the overhead then becomes the difference between the following:

Preemptive mode:

- Posting the semaphore that wakes the high-priority thread
- Performing a context switch to the high-priority thread

Cooperative mode:

- Setting the high-priority thread's event flag
- Acknowledging the event from the event loop

Using the cycle-accurate AVR simulator, we find the end-to-end event sequence time to be 20.4us for the cooperative mode scheduler and 44.2us for the preemptive, giving a difference of 23.8us.

With a fixed high-priority event frequency of 33Hz, we achieve a runtime overhead of 983.4us per second, or 0.0983% of the total available CPU time. Now, obviously this value would expand at higher event frequencies and/or slower CPU frequencies, but for this typical application we find the difference in runtime overhead to be negligible for a preemptive system. Analysis:

For the selected test application and platform, including a preemptive RTOS is entirely reasonable, as the costs are low relative to a non-preemptive kernel solution. But these costs scale relative to the speed, memory and code space of the target processor. Because of these variables, there is no "magic bullet" environment suitable for every application, but Mark3 attempts to provide a framework suitable for a wide range of targets.

On the one hand, if these tests had been performed on a higher-end microcontroller such as the ATmega1284p (containing 128kB of code space and 16kB of RAM), the overhead would be in the noise. For this type of resource-rich microcontroller, there would be no reason to avoid using the Mark3 preemptive kernel.

Conversely, using a lower-end microcontroller like an ATmega88pa (which has only 8kB of code space and 1kB of RAM), the added overhead would likely be prohibitive for including a preemptive kernel. In this case, the cooperative-mode kernel would be a better choice.

As a rule of thumb, if one budgets 10% of a microcontroller's code space/RAM for a preemptive kernel's overhead, you should only require at minimum a microcontroller with 16k of code space and 2kB of RAM as a base platform for an RTOS. Unless there are serious constraints on the system that require much better latency or responsiveness than can be achieved with RTOS overhead, almost any modern platform is sufficient for hosting a kernel. In the event you find yourself with a microprocessor with external memory, there should be no reason to avoid using an RTOS at all.

Chapter 4

Superloops

4.1 Intro to Superloops

Before we start taking a look at designing a real-time operating system, it's worthwhile taking a look through one of the most-common design patterns that developers use to manage task execution in embedded systems - Superloops.

Systems based on superloops favor the system control logic baked directly into the application code, usually under the guise of simplicity, or memory (code and RAM) efficiency. For simple systems, superloops can definitely get the job done. However, they have some serious limitations, and are not suitable for every kind of project. In a lot of cases you can squeak by using superloops - especially in extremely constrained systems, but in general they are not a solid basis for reusable, portable code.

Nonetheless, a variety of examples are presented here- from the extremely simple, to cooperative and limited-preemptive multitasking systems, all of which are examples are representative of real-world systems that I've either written the firmware for, or have seen in my experience.

4.2 The simplest loop

Let's start with the simplest embedded system design possible - an infinite loop that performs a single task repeatedly:

```
int main()
{
    while(1)
    {
        Do_Something();
    }
}
```

Here, the code inside the loop will run a single function forever and ever. Not much to it, is there? But you might be surprised at just how much embedded system firmware is implemented using essentially the same mechanism - there isn't anything wrong with that, but it's just not that interesting.

While the execution timeline for this program is equally boring, for the sake of completeness it would look like this:

Despite its simplicity we can see the beginnings of some core OS concepts. Here, the `while(1)` statement can be logically seen as the operating system kernel - this one control statement determines what tasks can run in the system, and defines the constraints that could modify their execution. But at the end of the day, that's a big part of what a kernel is - a mechanism that controls the execution of application code.

The second concept here is the task. This is application code provided by the user to perform some useful purpose in a system. In this case `Do_something()` represents that task - it could be monitoring blood pressure, reading a sensor and writing its data to a terminal, or playing an MP3; anything you can think of for an embedded system to do. A simple round-robin multi-tasking system can be built off of this example by simply adding additional tasks in

sequence in the main while-loop. Note that in this example the CPU is always busy running tasks - at no time is the CPU idle, meaning that it is likely burning a lot of power.

While we conceptually have two separate pieces of code involved here (an operating system kernel and a set of running tasks), they are not logically separate. The OS code is indistinguishable from the application. It's like a single-celled organism - everything is crammed together within the walls of an indivisible unit; and specialized to perform its given function relying solely on instinct.

4.3 Interrupt-Driven Super-loop

In the previous example, we had a system without any way to control the execution of the task- it just runs forever. There's no way to control when the task can (or more importantly can't) run, which greatly limits the usefulness of the system. Say you only want your task to run every 100 milliseconds - in the previous code, you have to add a hard-coded delay at the end of your task's execution to ensure your code runs only when it should.

Fortunately, there is a much more elegant way to do this. In this example, we introduce the concept of the synchronization object. A Synchronization object is some data structure which works within the bounds of the operating system to tell tasks when they can run, and in many cases includes special data unique to the synchronization event. There are a whole family of synchronization objects, which we'll get into later. In this example, we make use of the simplest synchronization primitive - the global flag.

With the addition of synchronization brings the addition of event-driven systems. If you're programming a microcontroller system, you generally have scores of peripherals available to you - timers, GPIOs, ADCs, UARTs, ethernet, USB, etc. All of which can be configured to provide a stimulus to your system by means of interrupts. This stimulus gives us the ability not only to program our micros to do_something(), but to do_something() if-and-only-if a corresponding trigger has occurred.

The following concepts are shown in the example below:

```
volatile K_BOOL something_to_do = false;

__interrupt__ My_Interrupt_Source(void)
{
    something_to_do = true;
}

int main()
{
    while(1)
    {
        if( something_to_do )
        {
            Do_something();
            something_to_do = false;
        }
        else
        {
            Idle();
        }
    }
}
```

So there you have it - an event driven system which uses a global variable to synchronize the execution of our task based on the occurrence of an interrupt. It's still just a bare-metal, OS-baked-into-the-application system, but it's introduced a whole bunch of added complexity (and control!) into the system.

The first thing to notice in the source is that the global variable, `something_to_do`, is used as a synchronization object. When an interrupt occurs from some external event, triggering the `My_Interrupt_Source()` ISR, program flow in `main()` is interrupted, the interrupt handler is run, and `something_to_do` is set to true, letting us know that when we get back to `main()`, that we should run our `Do_something()` task.

Another new concept at play here is that of the idle function. In general, when running an event driven system, there are times when the CPU has no application tasks to run. In order to minimize power consumption, CPUs usually contain instructions or registers that can be set up to disable non-essential subsets of the system when there's nothing to do. In general, the sleeping system can be re-activated quickly as a result of an interrupt or other external stimulus, allowing normal processing to resume.

Now, we could just call `Do_something()` from the interrupt itself - but that's generally not a great solution. In general, the more time we spend inside an interrupt, the more time we spend with at least some interrupts disabled. As a result, we end up with interrupt latency. Now, in this system, with only one interrupt source and only one task this might not be a big deal, but say that `Do_something()` takes several seconds to complete, and in that time several other interrupts occur from other sources. While executing in our long-running interrupt, no other interrupts can be processed - in many cases, if two interrupts of the same type occur before the first is processed, one of these interrupt events will be lost. This can be utterly disastrous in a real-time system and should be avoided at all costs. As a result, it's generally preferable to use synchronization objects whenever possible to defer processing outside of the ISR.

Another OS concept that is implicitly introduced in this example is that of task priority. When an interrupt occurs, the normal execution of code in `main()` is preempted: control is swapped over to the ISR (which runs to completion), and then control is given back to `main()` where it left off. The very fact that interrupts take precedence over what's running shows that `main` is conceptually a "low-priority" task, and that all ISRs are "high-priority" tasks. In this example, our "high-priority" task is setting a variable to tell our "low-priority" task that it can do something useful. We will investigate the concept of task priority further in the next example.

Preemption is another key principle in embedded systems. This is the notion that whatever the CPU is doing when an interrupt occurs, it should stop, cache its current state (referred to as its context), and allow the high-priority event to be processed. The context of the previous task is then restored its state before the interrupt, and resumes processing. We'll come back to preemption frequently, since the concept comes up frequently in RTOS-based systems.

4.4 Cooperative multi-tasking

Our next example takes the previous example one step further by introducing cooperative multi-tasking:

```
// Bitfield values used to represent three distinct tasks
#define TASK_1_EVENT (0x01)
#define TASK_2_EVENT (0x02)
#define TASK_3_EVENT (0x04)

volatile K_UCHAR event_flags = 0;

// Interrupt sources used to trigger event execution

__interrupt__ My_Interrupt_1(void)
{
    event_flags |= TASK_1_EVENT;
}

__interrupt__ My_Interrupt_2(void)
{
    event_flags |= TASK_2_EVENT;
}

__interrupt__ My_Interrupt_3(void)
{
    event_flags |= TASK_3_EVENT;
}

// Main tasks
int main(void)
{
    while(1)
    {
        while(event_flags)
        {
            if( event_flags & TASK_1_EVENT)
            {
                Do_Task_1();
                event_flags &= ~TASK_1_EVENT;
            } else if( event_flags & TASK_2_EVENT) {
                Do_Task_2();
                event_flags &= ~TASK_2_EVENT;
            } else if( event_flags & TASK_3_EVENT) {
                Do_Task_3();
                event_flags &= ~TASK_3_EVENT;
            }
        }
        Idle();
    }
}
```

This system is very similar to what we had before - however the differences are worth discussing. First, we have stimulus from multiple interrupt sources: each ISR is responsible for setting a single bit in our global event flag, which is then used to control execution of individual tasks from within main().

Next, we can see that tasks are explicitly given priorities inside the main loop based on the logic of the if/else if structure. As long as there is something set in the event flag, we will always try to execute Task1 first, and only when Task1 isn't set will we attempt to execute Task2, and then Task 3. This added logic provides the notion of priority. However, because each of these tasks exist within the same context (they're just different functions called from our main control loop), we don't have the same notion of preemption that we have when dealing with interrupts.

That means that even through we may be running Task2 and an event flag for Task1 is set by an interrupt, the CPU still has to finish processing Task2 to completion before Task1 can be run. And that's why this kind of scheduling is referred to as cooperative multitasking: we can have as many tasks as we want, but unless they cooperate by means of returning back to main, the system can end up with high-priority tasks getting starved for CPU time by lower-priority, long-running tasks.

This is one of the more popular Os-baked-into-the-application approaches, and is widely used in a variety of real-time embedded systems.

4.5 Hybrid cooperative/preemptive multi-tasking

The final variation on the superloop design utilizes software-triggered interrupts to simulate a hybrid cooperative/preemptive multitasking system. Consider the example code below.

```
// Bitfields used to represent high-priority tasks. Tasks in this group
// can preempt tasks in the group below - but not eachother.
#define HP_TASK_1      (0x01)
#define HP_TASK_2      (0x02)

volatile K_UCHAR hp_tasks = 0;

// Bitfields used to represent low-priority tasks.
#define LP_TASK_1      (0x01)
#define LP_TASK_2      (0x02)

volatile K_UCHAR lp_tasks = 0;

// Interrupt sources, used to trigger both high and low priority tasks.
__interrupt__ System_Interrupt_1(void)
{
    // Set any of the other tasks from here...
    hp_tasks |= HP_TASK_1;
    // Trigger the SWI that calls the High_Priority_Tasks interrupt handler
    SWI();
}

__interrupt__ System_Interrupt_n...(void)
{
    // Set any of the other tasks from here...
}

// Interrupt handler that is used to implement the high-priority event context
__interrupt__ High_Priority_Tasks(void)
{
    // Enabled every interrupt except this one
    Disable_My_Interrupt();
    Enable_Interrupts();
    while( hp_tasks)
    {
        if( hp_tasks & HP_TASK_1)
        {
            HP_Task1();
            hp_tasks &= ~HP_TASK_1;
        }
        else if (hp_tasks & HP_TASK_2)
        {
            HP_Task2();
            hp_tasks &= ~HP_TASK_2;
        }
    }
    Restore_Interrupts();
    Enable_My_Interrupt();
}
```

```
// Main loop, used to implement the low-priority events
int main(void)
{
    // Set the function to run when a SWI is triggered
    Set_SWI(High_Priority_Tasks);

    // Run our super-loop
    while(1)
    {
        while (lp_tasks)
        {
            if (lp_tasks & LP_TASK_1)
            {
                LP_Task1();
                lp_tasks &= ~LP_TASK_1;
            }
            else if (lp_tasks & LP_TASK_2)
            {
                LP_Task2();
                lp_tasks &= ~LP_TASK_2;
            }
        }
        Idle();
    }
}
```

In this example, `High_Priority_Tasks()` can be triggered at any time as a result of a software interrupt (SWI). When a high-priority event is set, the code that sets the event calls the SWI as well, which instantly preempts whatever is happening in main, switching to the high-priority interrupt handler. If the CPU is executing in an interrupt handler already, the current ISR completes, at which point control is given to the high priority interrupt handler.

Once inside the HP ISR, all interrupts (except the software interrupt) are re-enabled, which allows this interrupt to be preempted by other interrupt sources, which is called interrupt nesting. As a result, we end up with two distinct execution contexts (main and `HighPriorityTasks()`), in which all tasks in the high-priority group are guaranteed to preempt main() tasks, and will run to completion before returning control back to tasks in main(). This is a very basic preemptive multitasking scenario, approximating a "real" RTOS system with two threads of different priorities.

4.6 Problems with superloops

As mentioned earlier, a lot of real-world systems are implemented using a superloop design; and while they are simple to understand due to the limited and obvious control logic involved, they are not without their problems.

Hidden Costs

It's difficult to calculate the overhead of the superloop and the code required to implement workarounds for blocking calls, scheduling, and preemption. There's a cost in both the logic used to implement workarounds (usually involving state machines), as well as a cost to maintainability that comes with breaking up into chunks based on execution time instead of logical operations. In moderate firmware systems, this size cost can exceed the overhead of a reasonably well-featured RTOS, and the deficit in maintainability is something that is measurable in terms of lost productivity through debugging and profiling.

Tightly-coupled code

Because the control logic is integrated so closely with the application logic, a lot of care must be taken not to compromise the separation between application and system code. The timing loops, state machines, and architecture-specific control mechanisms used to avoid (or simulate) preemption can all contribute to the problem. As a result, a lot of superloop code ends up being difficult to port without effectively simulating or replicating the underlying system for which the application was written. Abstraction layers can mitigate the risks, but a lot of care should be taken to fully decouple the application code from the system code.

No blocking calls

In a super-loop environment, there's no such thing as a blocking call or blocking objects. Tasks cannot stop mid-execution for event-driven I/O from other contexts - they must always run to completion. If busy-waiting and polling are used as a substitute, it increases latency and wastes cycles. As a result, extra code complexity is often times necessary to work-around this lack of blocking objects, often times through implementing additional state machines. In a large enough system, the added overhead in code size and cycles can add up.

Difficult to guarantee responsiveness

Without multiple levels of priority, it may be difficult to guarantee a certain degree of real-time responsiveness without added profiling and tweaking. The latency of a given task in a priority-based cooperative multitasking system is the length of the longest task. Care must be taken to break tasks up into appropriate sized chunks in order to ensure that higher-priority tasks can run in a timely fashion - a manual process that must be repeated as new tasks are added in the system. Once again, this adds extra complexity that makes code larger, more difficult to understand and maintain due to the artificial subdivision of tasks into time-based components.

Limited preemption capability

As shown in the example code, the way to gain preemption in a superloop is through the use of nested interrupts. While this isn't unwieldy for two levels of priority, adding more levels beyond this becomes complicated. In this case, it becomes necessary to track interrupt nesting manually, and separate sets of tasks that can run within given priority loops - and deadlock becomes more difficult to avoid.

Chapter 5

Mark3 Overview

5.1 Intro

The following section details the overall design of Mark3, the goals I've set out to achieve, the features that I've intended to provide, as well as an introduction to the programming concepts used to make it happen.

5.2 Features

Mark3 is a fully-featured real-time kernel, and is feature-competitive with other open-source and commercial RTOS's in the embedded arena.

The key features of this RTOS are:

- Flexible [Scheduler](#)
 - Unlimited number of threads with 8 priority levels
 - Unlimited threads per priority level
 - Round-robin scheduling for threads at each priority level
 - Time quantum scheduling for each thread in a given priority level
- Configurable stacks for each [Thread](#)
- Resource protection:
 - Integrated mutual-exclusion semaphores ([Mutex](#))
 - Priority-inheritance on [Mutex](#) objects to prevent priority inversion
- Synchronization Objects
 - Binary and counting [Semaphore](#) to coordinate thread execution
- Efficient Timers
 - The RTOS is tickless, the OS only wakes up when a timer expires, not at a regular interval
 - One-shot and periodic timers with event callbacks
 - Timers are high-precision and long-counting (about 68000 seconds when used with a 16us resolution timer)
- [Driver](#) API
 - A hardware abstraction layer is provided to simplify driver development
- Robust Interprocess Communications
 - Threadsafe global [Message](#) pool and configurable message queues

5.3 Design Goals

Lightweight

Mark3 can be configured to have an extremely low static memory footprint. Each thread is defined with its own stack, and each thread structure can be configured to take as little as 26 bytes of RAM. The complete Mark3 kernel with all features, setup code, a serial driver, and the Mark3 protocol libraries comes in at under 9K of code space and 1K of RAM on atmel AVR.

Modular

Each system feature can be enabled or disabled by modifying the kernel configuration header file. Include what you want, and ignore the rest to save code space and RAM.

Easily Portable

Mark3 should be portable to a variety of 8, 16 and 32 bit architectures without MMUs. Porting the OS to a new architecture is relatively straightforward, requiring only device-specific implementations for the lowest-level operations such as context switching and timer setup.

Easy To Use

Mark3 is small by design - which gives it the advantage that it's also easy to develop for. This manual, the code itself, and the Doxygen documentation in the code provide ample documentation to get you up to speed quickly. Because you get to see the source, there's nothing left to assumption.

Simple to Understand

Not only is the Mark3 API rigorously documented (hey - that's what this book is for!), but the architecture and naming conventions are intuitive - it's easy to figure out where code lives, and how it works. Individual modules are small due to the "one feature per file" rule used in development. This makes Mark3 an ideal platform for learning about aspects of RTOS design.

Chapter 6

Getting Started

6.1 Kernel Setup

This section details the process of defining threads, initializing the kernel, and adding threads to the scheduler.

If you're at all familiar with real-time operating systems, then these setup and initialization steps should be familiar. I've tried very hard to ensure that as much of the heavy lifting is hidden from the user, so that only the bare minimum of calls are required to get things started.

The examples presented in this chapter are real, working examples taken from the ATmega328p port.

First, you'll need to create the necessary data structures and functions for the threads:

1. Create a [Thread](#) object for all of the "root" or "initial" tasks.
2. Allocate stacks for each of the Threads
3. Define an entry-point function for each [Thread](#)

This is shown in the example code below:

```
//-----  
#include "thread.h"  
#include "kernel.h"  
  
//1) Create a thread object for all of the "root" or "initial" tasks  
static Thread AppThread;  
static Thread IdleThread;  
  
//2) Allocate stacks for each thread  
#define STACK_SIZE_APP      (192)  
#define STACK_SIZE_IDLE     (128)  
  
static K_UCHAR aucAppStack[STACK_SIZE_APP];  
static K_UCHAR aucIdleStack[STACK_SIZE_IDLE];  
  
//3) Define entry point functions for each thread  
void AppThread(void);  
void IdleThread(void);
```

Next, we'll need to add the required kernel initialization code to main. This consists of running the [Kernel's](#) init routine, initializing all of the threads we defined, adding the threads to the scheduler, and finally calling [Kernel::Start\(\)](#), which transfers control of the system to the RTOS.

These steps are illustrated in the following example.

```
int main(void)  
{  
    //1) Initialize the kernel prior to use  
    Kernel::Init();  
  
    //2) Initialize all of the threads we've defined
```

```

AppThread.Init( aucAppStack,
                STACK_SIZE_APP,
                1,
                (void*)AppEntry,
                NULL );

IdleThread.Init( aucIdleStack,
                 STACK_SIZE_IDLE,
                 0,
                 4,
                 (void*)IdleEntry,
                 NULL );

//3) Add the threads to the scheduler
AppThread.Start();
IdleThread.Start();

//4) Give control of the system to the kernel
Kernel::Start();
}

```

Not much to it, is there? There are a few noteworthy points in this code, though.

In order for the kernel to work properly, a system must always contain an idle thread; that is, a thread at priority level 0 that never blocks. This thread is responsible for performing any of the low-level power management on the CPU in order to maximize battery life in an embedded device. The idle thread must also never block, and it must never exit. Either of these operations will cause undefined behavior in the system.

The App thread is at a priority level greater-than 0. This ensures that as long as the App thread has something useful to do, it will be given control of the CPU. In this case, if the app thread blocks, control will be given back to the Idle thread, which will put the CPU into a power-saving mode until an interrupt occurs.

Stack sizes must be large enough to accommodate not only the requirements of the threads, but also the requirements of interrupts - up to the maximum interrupt-nesting level used. Stack overflows are super-easy to run into in an embedded system; if you encounter strange and unexplained behavior in your code, chances are good that one of your threads is blowing its stack.

6.2 Threads

Mark3 Threads act as independent tasks in the system. While they share the same address-space, global data, device-drivers, and system peripherals, each thread has its own set of CPU registers and stack, collectively known as the thread's **context**. The context is what allows the RTOS kernel to rapidly switch between threads at a high rate, giving the illusion that multiple things are happening in a system, when really, only one thread is executing at a time.

6.2.1 Thread Setup

Each instance of the [Thread](#) class represents a thread, its stack, its CPU context, and all of the state and metadata maintained by the kernel. Before a [Thread](#) will be scheduled to run, it must first be initialized with the necessary configuration data.

The Init function gives the user the opportunity to set the stack, stack size, thread priority, entry-point function, entry-function argument, and round-robin time quantum:

[Thread](#) stacks are pointers to blobs of memory (usually K_CHAR arrays) carved out of the system's address space. Each thread must have a stack defined that's large enough to handle not only the requirements of local variables in the thread's code path, but also the maximum depth of the ISR stack.

Priorities should be chosen carefully such that the shortest tasks with the most strict determinism requirements are executed first - and are thus located in the highest priorities. Tasks that take the longest to execute (and require the least degree of responsiveness) must occupy the lower thread priorities. The idle thread must be the only thread occupying the lowest priority level.

The thread quantum only applies when there are multiple threads in the ready queue at the same priority level. This interval is used to kick-off a timer that will cycle execution between the threads in the priority list so that they each get a fair chance to execute.

The entry function is the function that the kernel calls first when the thread instance is first started. Entry functions have at most one argument - a pointer to a data-object specified by the user during initialization.

An example thread initialization is shown below:

```
Thread clMyThread;
K_UCHAR aucStack[192];

void AppEntry(void)
{
    while(1)
    {
        // Do something!
    }
}

...
{
    clMyThread.Init(aucStack,
                    192,
                    1,
                    4,
                    (void*)AppEntry,
                    NULL );
}
```

Once a thread has been initialized, it can be added to the scheduler by calling:

```
clMyThread.Start();
```

The thread will be placed into the [Scheduler's](#) queue at the designated priority, where it will wait its turn for execution.

6.2.2 Entry Functions

Mark3 Threads should not run-to-completion - they should execute as infinite loops that perform a series of tasks, appropriately partitioned to provide the responsiveness characteristics desired in the system.

The most basic [Thread](#) loop is shown below:

```
void Thread( void *param )
{
    while(1)
    {
        // Do Something
    }
}
```

Threads can interact with eachother in the system by means of synchronization objects ([Semaphore](#)), mutual-exclusion objects ([Mutex](#)), Inter-process messaging ([MessageQueue](#)), and timers ([Timer](#)).

Threads can suspend their own execution for a predetermined period of time by using the static [Thread::Sleep\(\)](#) method. Calling this will block the [Thread's](#) executin until the amount of time specified has ellapsed. Upon expiry, the thread will be placed back into the ready queue for its priority level, where it awaits its next turn to run.

6.3 Timers

[Timer](#) objects are used to trigger callback events periodic or on a one-shot (alarm) basis.

While extremely simple to use, they provide one of the most powerful execution contexts in the system. The timer callbacks execute from within the timer callback ISR in an interrupt-enabled context. As such, timer callbacks are considered higher-priority than any thread in the system, but lower priority than other interrupts. Care must be taken to ensure that timer callbacks execute as quickly as possible to minimize the impact of processing on the throughput of tasks in the system. Wherever possible, heavy-lifting should be deferred to the threads by way of semaphores or messages.

Below is an example showing how to start a periodic system timer which will trigger every second:

```

{
    Timer clTimer;
    clTimer.Init();

    clTimer.Start( 1000,
                  1,
                  MyCallback,
                  (void*)&my_data );

    ... // Keep doing work in the thread
}

// Callback function, executed from the timer-expiry context.
void MyCallback( Thread *pclOwner_, void *pvData_ )
{
    LED.Flash(); // Flash an LED.
}

```

6.4 Semaphores

Semaphores are used to synchronized execution of threads based on the availability (and quantity) of application-specific resources in the system. They are extremely useful for solving producer-consumer problems, and are the method-of-choice for creating efficient, low latency systems, where ISRs post semaphores that are handled from within the context of individual threads. (Yes, Semaphores can be posted - but not pended - from the interrupt context).

The following is an example of the producer-consumer usage of a binary semaphore:

```

Semaphore clSemaphore; // Declare a semaphore shared between a producer and a consumer thread.

void Producer()
{
    clSemaphore.Init(0, 1);
    while(1)
    {
        // Do some work, create something to be consumed

        // Post a semaphore, allowing another thread to consume the data
        clSemaphore.Post();
    }
}

void Consumer()
{
    // Assumes semaphore initialized before use...
    While(1)
    {
        // Wait for new data from the producer thread
        clSemaphore.Pend();

        // Consume the data!
    }
}

```

And an example of using semaphores from the ISR context to perform event- driven processing.

```

Semaphore clSemaphore;

__interrupt__ MyISR()
{
    clSemaphore.Post(); // Post the interrupt. Lightweight when uncontested.
}

void MyThread()
{
    clSemaphore.Init(0, 1); // Ensure this is initialized before the MyISR interrupt is enabled.
    while(1)
    {
        // Wait until we get notification from the interrupt
        clSemaphore.Pend();

        // Interrupt has fired, do the necessary work in this thread's context
        HeavyLifting();
    }
}

```

6.5 Mutexes

Mutexes (Mutual exclusion objects) are provided as a means of creating "protected sections" around a particular resource, allowing for access of these objects to be serialized. Only one thread can hold the mutex at a time - other threads have to wait until the region is released by the owner thread before they can take their turn operating on the protected resource. Note that mutexes can only be owned by threads - they are not available to other contexts (i.e. interrupts). Calling the mutex APIs from an interrupt will cause catastrophic system failures.

Note that these objects are also not recursive- that is, the owner thread can not attempt to claim a mutex more than once.

Priority inheritance is provided with these objects as a means to avoid priority inversions. Whenever a thread at a priority than the mutex owner blocks on a mutex, the priority of the current thread is boosted to the highest-priority waiter to ensure that other tasks at intermediate priorities cannot artificially prevent progress from being made.

[Mutex](#) objects are very easy to use, as there are only three operations supported: Initialize, Claim and Release. An example is shown below.

```

Mutex clMutex; // Create a mutex globally.

void Init()
{
    // Initialize the mutex before use.
    clMutex.Init();
}

// Some function called from a thread
void Thread1Function()
{
    clMutex.Claim();

    // Once the mutex is owned, no other thread can
    // enter a block protect by the same mutex

    my_protected_resource.do_something();
    my_protected_resource.do_something_else();

    clMutex.Release();
}

// Some function called from another thread
void Thread2Function()
{
    clMutex.Claim();

    // Once the mutex is owned, no other thread can
    // enter a block protect by the same mutex

    my_protected_resource.do_something();
    my_protected_resource.do_different_things();

    clMutex.Release();

```

6.6 Messages

Sending messages between threads is the key means of synchronizing access to data, and the primary mechanism to perform asynchronous data processing operations.

Sending a message consists of the following operations:

- Obtain a [Message](#) object from the global message pool
- Set the message data and event fields
- Send the message to the destination message queue

While receiving a message consists of the following steps:

- Wait for a messages in the destination message queue

- Process the message data
- Return the message back to the global message pool

These operations, and the various data objects involved are discussed in more detail in the following section.

6.6.1 Message Objects

[Message](#) objects are used to communicate arbitrary data between threads in a safe and synchronous way.

The message object consists of an event code field and a data field. The event code is used to provide context to the message object, while the data field (essentially a void * data pointer) is used to provide a payload of data corresponding to the particular event.

Access to these fields is marshalled by accessors - the transmitting thread uses the `SetData()` and `SetCode()` methods to seed the data, while the receiving thread uses the `GetData()` and `GetCode()` methods to retrieve it.

By providing the data as a void data pointer instead of a fixed-size message, we achieve an unprecedented measure of simplicity and flexibility. Data can be either statically or dynamically allocated, and sized appropriately for the event without having to format and reformat data by both sending and receiving threads. The choices here are left to the user - and the kernel doesn't get in the way of efficiency.

It is worth noting that you can send messages to message queues from within ISR context. This helps maintain consistency, since the same APIs can be used to provide event-driven programming facilities throughout the whole of the OS.

6.6.2 Global Message Pool

To maintain efficiency in the messaging system (and to prevent over-allocation of data), a global pool of message objects is provided. The size of this message pool is specified in the implementation, and can be adjusted depending on the requirements of the target application as a compile-time option.

Allocating a message from the message pool is as simple as calling the `GlobalMessagePool::Pop()` Method.

Messages are returned back to the `GlobalMessagePool::Push()` method once the message contents are no longer required.

One must be careful to ensure that discarded messages always are returned to the pool, otherwise a resource leak can occur, which may cripple the operating system's ability to pass data between threads.

6.6.3 Message Queues

[Message](#) objects specify data with context, but do not specify where the messages will be sent. For this purpose we have a [MessageQueue](#) object. Sending an object to a message queue involves calling the `MessageQueue::Send()` method, passing in a pointer to the [Message](#) object as an argument.

When a message is sent to the queue, the first thread blocked on the queue (as a result of calling the `MessageQueue::Receive()` method) will wake up, with a pointer to the [Message](#) object returned.

It's worth noting that multiple threads can block on the same message queue, providing a means for multiple threads to share work in parallel.

6.6.4 Messaging Example

```
// Message queue object shared between threads
MessageQueue clMsgQ;

// Function that initializes the shared message queue
void MsgQInit()
{
    clMsgQ.Init();
}
```

```
// Function called by one thread to send message data to
// another
void TxMessage()
{
    // Get a message, initialize its data
    Message *pclMesg = GlobalMessagePool::Pop();

    pclMesg->SetCode(0xAB);
    pclMesg->SetData((void*) some_data);

    // Send the data to the message queue
    clMsgQ.Send(pclMesg);
}

// Function called in the other thread to block until
// a message is received in the message queue.
void RxMessage()
{
    Message *pclMesg;

    // Block until we have a message in the queue
    pclMesg = clMsgQ.Receive();

    // Do something with the data once the message is received
    pclMesg->GetCode();

    // Free the message once we're done with it.
    GlobalMessagePool::Push(pclMesg);
}
```

6.7 Sleep

There are instances where it may be necessary for a thread to poll a resource, or wait a specific amount of time before proceeding to operate on a peripheral or volatile piece of data.

While the [Timer](#) object is generally a better choice for performing time-sensitive operations (and certainly a better choice for periodic operations), the [Thread::Sleep\(\)](#) method provides a convenient (and efficient) mechanism that allows for a thread to suspend its execution for a specified interval.

Note that when a thread is sleeping it is blocked, during which other threads can operate, or the system can enter its idle state.

```
int GetPeripheralData()
{
    int value;
    // The hardware manual for a peripheral specifies that
    // the "foo()" method will result in data being generated
    // that can be captured using the "bar()" method.
    // However, the value only becomes valid after 10ms

    peripheral.foo();
    Thread::Sleep(10); // Wait 10ms for data to become valid
    value = peripheral.bar();
    return value;
}
```

6.8 Round-Robin Quantum

Threads at the same thread priority are scheduled using a round-robin scheme. Each thread is given a timeslice (which can be configured) of which it shares time amongst ready threads in the group. Once a thread's timeslice has expired, the next thread in the priority group is chosen to run until its quantum has expired - the cycle continues over and over so long as each thread has work to be done.

By default, the round-robin interval is set at 4ms.

This value can be overridden by calling the thread's [SetQuantum\(\)](#) with a new interval specified in milliseconds.

Chapter 7

Build System

Mark3 is distributed with a recursive makefile build system, allowing the entire source tree to be built into a series of libraries with simple make commands.

The way the scripts work, every directory with a valid makefile is scanned, as well as all of its subdirectories. The build then generates binary components for all of the components it finds -libraries and executables. All libraries that are generated can then be imported into an application using the linker without having to copy-and-paste files on a module-by-module basis. Applications built during this process can then be loaded onto a device directly, without requiring a GUI-based IDE. As a result, Mark2 integrates well with 3rd party tools for continuous-integration and automated testing.

This modular framework allows for large volumes of libraries and binaries to be built at once - the default build script leverages this to build all of the examples and unit tests at once, linking against the pre-built kernel, services, and drivers. Whatever can be built as a library is built as a library, promoting reuse throughout the platform, and enabling Mark3 to be used as a platform, with an ecosystem of libraries, services, drivers and applications.

7.1 Source Layout

One key aspect of Mark2 is that system features are organized into their own separate modules. These modules are further grouped together into folders based on the type of features represented:

Root	Base folder, contains recursive makefiles for build system
bootloader	Mark2 Bootloader code for AVR
build	Makefile support for various platforms
doc	Documentation (including this)
drivers	Device driver code
example	Example applications
kernel	Basic Mark2 Components (the focus of this manual)
cpu	CPU-specific porting code
services	Utility code and services, extended system features
stage	Staging directory, where the build system places artifacts
tests	Unit tests, written as C/C++ applications

7.2 Building the kernel

The base.mak file determines how the kernel, drivers, and libraries are built, for what targets, and with what options. Most of these options can be copied directly from the options found in your IDE managed projects. Below is an overview of the main variables used to configure the build.

STAGE	- Location in the filesystem where the build output is stored
ROOT_DIR	- The location of the root source tree
ARCH	- The CPU architecture to build against
VARIANT	- The variant of the above CPU to target
TOOLCHAIN	- Which toolchain to build with (dependent on ARCH and VARIANT)

Build.mak contains the logic which is used to perform the recursive make in all directories. Unless you really know what you're doing, it's best to leave this as-is.

You must make sure that all required paths are set in your system environment variables so that they are accessible through from the command-line.

Once configured, you can build the source tree using the various make targets:

- make headers
 - copy all headers in each module's /public subdirectory to the location specified by STAGE environment variable's ./inc subdirectory.
- make library
 - regenerate all objects copy marked as libraries (i.e. the kernel + drivers). Resulting binaries are copied into STAGE's ./lib subdirectory.
- make binary
 - build all executable projects in the root directory structure. In the default distribution, this includes the basic set of demos.

To add new components to the recursive build system, simply add your code into a new folder beneath the root install location.

Source files, the module makefile and private header files go directly in the new folder, while public headers are placed in a ./public subdirectory. Create a ./obj directory to hold the output from the builds.

The contents of the module makefile looks something like this:

```
# Include common prelude make file
include $(ROOT_DIR)base.mak

# If we're building a library, set IS_LIB and LIBNAME
# If we're building an app, set IS_APP and APPNAME
IS_LIB=1
LIBNAME=mylib

#this is the list of the source modules required to build the kernel
CPP_SOURCE = mylib.cpp \
             someotherfile.cpp

# Similarly, C-language source would be under the C_SOURCE variable.

# Include the rest of the script that is actually used for building the
# outputs
include $(ROOT_DIR)build.mak
```

Once you've placed your code files in the right place, and configured the makefile appropriately, a fresh call to make headers, make library, then make binary will guarantee that your code is built.

Now, you can still copy-and-paste the required kernel, port, and drivers, directly into your application avoiding the whole process of using make from the command line. To do this, run "make source" from the root directory in svn, and copy the contents of /stage/src into your project. This should contain the source to the kernel, all drivers, and all services that are in the tree - along with the necessary header files.

7.3 Building on Windows

Building Mark3 on Windows is the same as on Linux, but there are a few prerequisites that need to be taken into consideration before the build scripts and makefiles will work as expected.

Step 1 - Install Latest Atmel Studio IDE

Atmel Studio contains the AVR8 GCC toolchain, which contains the necessary compilers, assemblers, and platform support required to turn the source modules into libraries and executables.

To get Atmel Studio, go to the Atmel website (<http://www.atmel.com>) and register to download the latest version. This is a free download (and rather large). The included IDE (if you choose to use it) is very slick, as it's based on Visual Studio, and contains a wonderful cycle-accurate simulator for AVR devices. In fact, the simulator is so good that most of the kernel and its drivers were developed using this tool.

Once you have downloaded and installed Atmel Studio, you will need to add the location of the AVR toolchain to the PATH environment variable.

To do this, go to Control Panel -> System and Security -> System -> Advanced System Settings, and edit the PATH variable. Append the location of the toolchain bin folder to the end of the variable.

On Windows 7 x64, it should look something like this:

C: Files (x86) Toolchain GCC\Native\3.4.2.1002-gnu-toolchain

Step 2 - Install MinGW and MinSys

MinGW (and MinSys in particular) provide a unix-like environment that runs under windows. Some of the utilities provided include a version of the bash shell, and GNU standard make - both which are required by the Mark3 recursive build system.

The MinGW installer can be downloaded from its project page on SourceForge. When installing, be sure to select the "MinSys" component.

Once installed, add the MinSys binary path to the PATH environment variable, in a similar fashion as with Atmel Studio in Step 1.

Step 3 - Setup Include Paths in Platform Makefile

The AVR header file path must be added to the "platform.mak" makefile for each AVR Target you are attempting to build for. These files can be located under /embedded/build/avr/atmegaXXX/. The path to the includes directory should be added to the end of the CFLAGS and CPPFLAGS variables, as shown in the following:

```
TEST_INC="/c/Program Files (x86)/Atmel/Atmel Toolchain/AVR8
GCC/Native/3.4.2.1002/avr8-gnu-toolchain/include"
CFLAGS += -I$(TEST_INC)
CPPFLAGS += -I$(TEST_INC)
```

Step 4 - Build Mark3 using Bash

Launch a terminal to your Mark3 base directory, and cd into the "embedded" folder. You should now be able to build Mark3 by running "bash ./build.sh" from the command-line.

Alternately, you can run bash itself, building Mark3 by running ./build.sh or the various make targets using the same syntax as documented previously.

Note - building on Windows is *slow*. This has a lot to do with how "make" performs under windows. There are faster substitutes for make (such as cs-make) that are exponentially quicker, and approach the performance of make on Linux. Other mechanisms, such as running make with multiple concurrent jobs (i.e. "make -j4") also helps significantly, especially on systems with multicore CPUs.

Chapter 9

Profiling Results

The following profiling results were obtained using an ATmega328p @ 16MHz.

The test cases are designed to make use of the kernel profiler, which accurately measures the performance of the fundamental system APIs, in order to provide information for user comparison, as well as to ensure that regressions are not being introduced into the system.

9.1 Date Performed

Sat Jun 1 10:43:06 EDT 2013

9.2 Compiler Information

The kernel and test code used in these results were built using the following compiler: `./profile.sh: 55: ./profile.sh: /home/moslevin/atmel/bin/avr-gcc: not found`

9.3 Profiling Results

- Semaphore Initialization: 7 cycles (averaged over 83 iterations)
- Semaphore Post (uncontested): 180 cycles (averaged over 83 iterations)
- Semaphore Pend (uncontested): 67 cycles (averaged over 83 iterations)
- Semaphore Flyback Time (Contested Pend): 1553 cycles (averaged over 83 iterations)
- Mutex Init: 0 cycles (averaged over 83 iterations)
- Mutex Claim: 143 cycles (averaged over 83 iterations)
- Mutex Release: 49 cycles (averaged over 83 iterations)
- Thread Initialize: 7800 cycles (averaged over 83 iterations)
- Thread Start: 803 cycles (averaged over 83 iterations)
- Context Switch: 198 cycles (averaged over 83 iterations)
- Thread Schedule: 47 cycles (averaged over 83 iterations)

Chapter 10

Hierarchical Index

10.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

BlockHeap	43
BlockingObject	45
Mutex	120
Semaphore	156
CommandLine_t	51
DCPU	51
DCPU_Registers	55
DrawBitmap_t	61
DrawCircle_t	61
DrawEllipse_t	62
DrawLine_t	63
DrawMove_t	63
DrawPoint_t	64
DrawPoly_t	64
DrawRectangle_t	65

Chapter 11

Class Index

11.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

BlockHeap	
Single-block-size heap	43
BlockingObject	
Class implementing thread-blocking primitives	45
ButtonControl	46
CheckBoxControl	48
CircularLinkedList	
Circular-linked-list data type, inherited from the base LinkedList type	49
CommandLine_t	
Structure containing multiple representations for command-line data	51
DCPU	
DCPU emulator, used for running code out of EEPROM, RAM, or other memory interfaces than FLASH	51
DCPU_Registers	
Structure defining the DCPU hardware registers	55
DCPUPlugin	
Class used to provide the hardware device abstraction between the DCPU-16 emulator/VM and the host system	55
DevNull	
This class implements the "default" driver (/dev/null)	57
DoubleLinkedList	
Doubly-linked-list data type, inherited from the base LinkedList type	60
DrawBitmap_t	
Defines a bitmap	61
DrawCircle_t	
Defines a circle	61
DrawEllipse_t	
Defines a ellipse	62
DrawLine_t	
Defines a simple line	63
DrawMove_t	
Simple 2D copy/paste	63
DrawPoint_t	
Defines a pixel	64
DrawPoly_t	
Defines the structure of an arbitrary polygon	64
DrawRectangle_t	
Defines a rectangle	65

DrawStamp_t	Defines a 1-bit 2D bitmap of arbitrary resolution	65
DrawText_t	Defines a bitmap-rendered string	66
DrawVector_t	Specifies a single 2D point	67
DrawWindow_t	Defines the active window - establishes boundaries for drawing on the current display	67
Driver	Base device-driver class used in hardware abstraction	68
DriverList	List of Driver objects used to keep track of all device drivers in the system	70
FixedHeap	Fixed-size-block heap allocator with multiple block sizes	72
Font_t	73
GamePanelControl	74
GlobalMessagePool	Implements a list of message objects shared between all threads	75
Glyph_t	76
GraphicsDriver	Defines the base graphics driver class, which is inherited by all other graphics drivers	77
GroupBoxControl	81
GuiControl	GUI Control Base Class	83
GuiEvent_t	Composite UI event structure	90
GuiEventSurface	GUI Event Surface Object	91
GuiWindow	Basic Window Class	93
HeapConfig	Heap configuration object	99
JoystickEvent_t	Joystick UI event structure	100
Kernel	Class that encapsulates all of the kernel startup functions	101
KernelSWI	Class providing the software-interrupt required for context-switching in the kernel	102
KernelTimer	Hardware timer interface, used by all scheduling/timer subsystems	104
KeyEvent_t	Keyboard UI event structure definition	106
LabelControl	106
LinkList	Abstract-data-type from which all other linked-lists are derived	108
LinkListNode	Basic linked-list node data structure	110
MemUtil	String and Memory manipulation class	111
Message	Class to provide message-based IPC services in the kernel	115
MessageQueue	List of messages, used as the channel for sending and receiving messages between threads	117
MouseEvent_t	Mouse UI event structure	119
Mutex	Mutual-exclusion locks, based on BlockingObject	120

NLFS		
Nice Little File System class	122	
NLFS_Block_t		
Block data structure	132	
NLFS_File		
The NLFS_File class	133	
NLFS_File_Node_t		
Data structure for the "file" FS-node type	135	
NLFS_File_Stat_t		
Structure used to report the status of a given file	136	
NLFS_Host_t		
Union used for managing host-specific pointers/data-types	137	
NLFS_Node_t		
Filesystem node data structure	137	
NLFS_RAM		
The NLFS_RAM class	138	
NLFS_Root_Node_t		
Data structure for the Root-configuration FS-node type	140	
NotificationControl	141	
Option_t		
Structure used to represent a command-line option with its arguments	143	
PanelControl	143	
Profiler		
System profiling timer interface	145	
ProfileTimer		
Profiling timer	146	
ProgressControl	148	
Quantum		
Static-class used to implement Thread quantum functionality, which is a key part of round-robin scheduling	150	
Scheduler		
Priority-based round-robin Thread scheduling, using ThreadLists for housekeeping	151	
Screen	154	
ScreenList	155	
ScreenManager	155	
Semaphore		
Counting semaphore, based on BlockingObject base class	156	
ShellCommand_t		
Data structure defining a lookup table correlating a command name to its handler function	158	
ShellSupport		
Features utility functions which handle token processing, option/parameter lookup, and functions making it generally trivial to implement a lightweight custom shell	159	
SlickButtonControl	161	
SlickGroupBoxControl	162	
SlickProgressControl	164	
Slip		
Object used to frame communications over an abstract device using the serial-line internet protocol (SLIP)	166	
SlipDataVector		
Data structure used for vector-based SLIP data transmission	168	
SlipMux		
Static-class which implements a multiplexed stream of SLIP data over a single interface	169	
SlipTerm		
Class implementing a simple debug terminal interface	171	
StubControl		
Stub control class, used for testing out the GUI framework where certain controls have not yet been implemented	173	

SystemHeap	Implements a heap which is accessible from all components in the system	175
Thread	Object providing fundamental multitasking support in the kernel	176
ThreadList	This class is used for building thread-management facilities, such as schedulers, and blocking objects	182
ThreadPort	Class defining the architecture specific functions required by the kernel	185
Timer	Timer - an event-driven execution context based on a specified time interval	186
TimerEvent_t	Timer UI event structure	189
TimerList	TimerList class - a doubly-linked-list of timer objects	189
TimerScheduler	"Static" Class used to interface a global TimerList with the rest of the kernel	190
Token_t	Token descriptor struct format	192
TouchEvent_t	Touch UI event structure	192
UnitTest	Class used to implement a simple unit-testing framework	193
WriteBuffer16	This class is used to provide a general-purpose, fully thread-safe circular buffer implementation which can be used for creating tracebuffers, data logging queues, transaction queues, etc . . .	196

Chapter 12

File Index

12.1 File List

Here is a list of all documented files with brief descriptions:

/home/moslevin/m3/embedded/stage/src/blocking.cpp	
Implementation of base class for blocking objects	199

Chapter 13

Class Documentation

13.1 BlockHeap Class Reference

Single-block-size heap.

```
#include <fixed_heap.h>
```

Public Member Functions

- void * [Create](#) (void *pvHeap_, K_USHORT usSize_, K_USHORT usBlockSize_)
Create a single list heap in the blob of memory provided, with the selected heap size, and the selected number of blocks.
- void * [Alloc](#) ()
Allocate a block of memory from this heap.
- void [Free](#) (void *pvData_)
Free a previously allocated block of memory.
- K_BOOL [IsFree](#) ()
Returns the state of a heap - whether or not it has free elements.

Protected Attributes

- K_USHORT [m_usBlocksFree](#)
Number of blocks free in the heap.

Private Attributes

- [DoubleLinkedList](#) [m_clList](#)
Linked list used to manage the blocks.

13.1.1 Detailed Description

Single-block-size heap.

Definition at line 29 of file [fixed_heap.h](#).

13.1.2 Member Function Documentation

13.1.2.1 void * BlockHeap::Alloc ()

Allocate a block of memory from this heap.

Returns

pointer to a block of memory, or 0 on failure

Definition at line 83 of file [fixed_heap.cpp](#).

13.1.2.2 void * BlockHeap::Create (void * pvHeap_, K_USHORT usSize_, K_USHORT usBlockSize_)

Create a single list heap in the blob of memory provided, with the selected heap size, and the selected number of blocks.

Will create as many blocks as will fit in the usSize_ parameter

Parameters

<i>pvHeap_</i>	Pointer to the heap data to initialize
<i>usSize_</i>	Size of the heap range in bytes
<i>usBlockSize_</i>	Size of each heap block in bytes

Returns

Pointer to the next heap element to initialize

Definition at line 48 of file [fixed_heap.cpp](#).

13.1.2.3 void BlockHeap::Free (void * pvData_)

Free a previously allocated block of memory.

Parameters

<i>pvData_</i>	Pointer to a block of data previously allocated off the heap.
----------------	---------------------------------------------------------------

Definition at line 102 of file [fixed_heap.cpp](#).

13.1.2.4 K_BOOL BlockHeap::IsFree () [inline]

Returns the state of a heap - whether or not it has free elements.

Returns

true if the heap is not full, false if the heap is full

Definition at line 74 of file [fixed_heap.h](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/fixed_heap.h](#)
- [/home/moslevin/m3/embedded/stage/src/fixed_heap.cpp](#)

13.2 BlockingObject Class Reference

Class implementing thread-blocking primitives.

```
#include <blocking.h>
```

Inheritance diagram for BlockingObject:

Protected Member Functions

- void [Block](#) ([Thread](#) **pciThread_*)
- void [UnBlock](#) ([Thread](#) **pciThread_*)

Protected Attributes

- [ThreadList](#) *m_clBlockList*
ThreadList which is used to hold the list of threads blocked on a given object.

13.2.1 Detailed Description

Class implementing thread-blocking primitives.

Used for implementing things like semaphores, mutexes, message queues, or anything else that could cause a thread to suspend execution on some external stimulus.

Definition at line 65 of file [blocking.h](#).

13.2.2 Member Function Documentation

13.2.2.1 void [BlockingObject::Block](#) ([Thread](#) * *pciThread_*) [protected]

Parameters

<i>pciThread_</i>	Pointer to the thread object that will be blocked.
-------------------	----------------------------------------------------

Blocks a thread on this object. This is the fundamental operation performed by any sort of blocking operation in the operating system. All semaphores/mutexes/sleeping/messaging/etc ends up going through the blocking code at some point as part of the code that manages a transition from an "active" or "waiting" thread to a "blocked" thread.

The steps involved in blocking a thread (which are performed in the function itself) are as follows;

1) Remove the specified thread from the current owner's list (which is likely one of the scheduler's thread lists) 2) Add the thread to this object's thread list 3) Setting the thread's "current thread-list" point to reference this object's threadlist.

Definition at line 36 of file [blocking.cpp](#).

13.2.2.2 void [BlockingObject::UnBlock](#) ([Thread](#) * *pciThread_*) [protected]

Parameters

<code>pclThread_</code>	Pointer to the thread to unblock.
-------------------------	-----------------------------------

Unblock a thread that is already blocked on this object, returning it to the "ready" state by performing the following steps:

- 1) Removing the thread from this object's threadlist
- 2) Restoring the thread to its "original" owner's list

Definition at line 52 of file [blocking.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/blocking.h](#)
- [/home/moslevin/m3/embedded/stage/src/blocking.cpp](#)

13.3 ButtonControl Class Reference

Inheritance diagram for ButtonControl:

Public Member Functions

- virtual void [Init](#) ()
Initialiize the control - must be called before use.
- virtual void [Draw](#) ()
Redraw the control "cleanly".
- virtual [GuiReturn_t](#) [ProcessEvent](#) ([GuiEvent_t](#) *pstEvent_)
Process an event sent to the control.
- virtual void [Activate](#) (bool bActivate_)
Activate or deactivate the current control - used when switching from one active control to another.
- void [SetBGColor](#) (COLOR eColor_)
- void [SetLineColor](#) (COLOR eColor_)
- void [SetFillColor](#) (COLOR eColor_)
- void [SetTextColor](#) (COLOR eColor_)
- void [SetActiveColor](#) (COLOR eColor_)
- void [SetFont](#) ([Font_t](#) *pstFont_)
- void [SetCaption](#) (const K_CHAR *szCaption_)
- void [SetCallback](#) (ButtonCallback pfCallback_, void *pvData_)

Private Attributes

- const K_CHAR * [m_szCaption](#)
- [Font_t](#) * [m_pstFont](#)
- COLOR [m_uBGColor](#)
- COLOR [m_uActiveColor](#)
- COLOR [m_uLineColor](#)

- COLOR **m_uFillColor**
- COLOR **m_uTextColor**
- bool **m_bState**
- void * **m_pvCallbackData**
- ButtonCallback **m_pfCallback**

Additional Inherited Members

13.3.1 Detailed Description

Definition at line 32 of file [control_button.h](#).

13.3.2 Member Function Documentation

13.3.2.1 void ButtonControl::Activate (bool *bActivate_*) [virtual]

Activate or deactivate the current control - used when switching from one active control to another.

Parameters

<i>bActivate_</i>	- true to activate, false to deactivate
-------------------	-----------------------------------------

Implements [GuiControl](#).

Definition at line 215 of file [control_button.cpp](#).

13.3.2.2 void ButtonControl::Draw () [virtual]

Redraw the control "cleanly".

Subclass specific.

Implements [GuiControl](#).

Definition at line 39 of file [control_button.cpp](#).

13.3.2.3 void ButtonControl::Init () [virtual]

Initialiize the control - must be called before use.

Implementation is subclass specific.

Implements [GuiControl](#).

Definition at line 25 of file [control_button.cpp](#).

13.3.2.4 GuiReturn_t ButtonControl::ProcessEvent (GuiEvent_t * *pstEvent_*) [virtual]

Process an event sent to the control.

Subclass specific implementation.

Parameters

<i>pstEvent_</i>	Pointer to a struct containing the event data
------------------	-----------------------------------------------

Implements [GuiControl](#).

Definition at line 117 of file [control_button.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/control_button.h](#)
- [/home/moslevin/m3/embedded/stage/src/control_button.cpp](#)

13.4 CheckBoxControl Class Reference

Inheritance diagram for CheckBoxControl:

Public Member Functions

- virtual void **Init** ()
Initialize the control - must be called before use.
- virtual void **Draw** ()
Redraw the control "cleanly".
- virtual **GuiReturn_t ProcessEvent** (**GuiEvent_t** *pstEvent_)
Process an event sent to the control.
- virtual void **Activate** (bool bActivate_)
Activate or deactivate the current control - used when switching from one active control to another.
- void **SetFont** (**Font_t** *pstFont_)
- void **SetCaption** (const char *szCaption_)
- void **SetCheck** (bool bChecked_)
- void **SetFontColor** (COLOR uFontColor_)
- void **SetBoxColor** (COLOR uBoxColor_)
- void **SetBackColor** (COLOR uBackColor_)
- bool **IsChecked** (void)

Private Attributes

- const char * **m_szCaption**
- COLOR **m_uBackColor**
- COLOR **m_uBoxColor**
- COLOR **m_uFontColor**
- **Font_t** * **m_pstFont**
- bool **m_bChecked**

Additional Inherited Members

13.4.1 Detailed Description

Definition at line 29 of file [control_checkbox.h](#).

13.4.2 Member Function Documentation

13.4.2.1 `virtual void CheckBoxControl::Activate (bool bActivate_) [inline], [virtual]`

Activate or deactivate the current control - used when switching from one active control to another.

Parameters

<i>bActivate_</i>	- true to activate, false to deactivate
-------------------	-----------------------------------------

Implements [GuiControl](#).

Definition at line 35 of file [control_checkbox.h](#).

13.4.2.2 `void CheckBoxControl::Draw () [virtual]`

Redraw the control "cleanly".

Subclass specific.

Implements [GuiControl](#).

Definition at line 59 of file [control_checkbox.cpp](#).

13.4.2.3 `void CheckBoxControl::Init () [virtual]`

Initialilize the control - must be called before use.

Implementation is subclass specific.

Implements [GuiControl](#).

Definition at line 53 of file [control_checkbox.cpp](#).

13.4.2.4 `GuiReturn_t CheckBoxControl::ProcessEvent (GuiEvent_t * pstEvent_) [virtual]`

Process an event sent to the control.

Subclass specific implementation.

Parameters

<i>pstEvent_</i>	Pointer to a struct containing the event data
------------------	-----------------------------------------------

Implements [GuiControl](#).

Definition at line 130 of file [control_checkbox.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/control_checkbox.h](#)
- [/home/moslevin/m3/embedded/stage/src/control_checkbox.cpp](#)

13.5 CircularLinkedList Class Reference

Circular-linked-list data type, inherited from the base [LinkedList](#) type.

```
#include <ll.h>
```

Inheritance diagram for CircularLinkedList:

Public Member Functions

- virtual void [Add](#) ([LinkedListNode](#) *node_)
Add the linked list node to this linked list.
- virtual void [Remove](#) ([LinkedListNode](#) *node_)
Add the linked list node to this linked list.
- void [PivotForward](#) ()
Pivot the head of the circularly linked list forward (Head = Head->next, Tail = Tail->next)
- void [PivotBackward](#) ()
Pivot the head of the circularly linked list backward (Head = Head->prev, Tail = Tail->prev)

Additional Inherited Members

13.5.1 Detailed Description

Circular-linked-list data type, inherited from the base [LinkedList](#) type.

Definition at line 205 of file [ll.h](#).

13.5.2 Member Function Documentation

13.5.2.1 void [CircularLinkedList::Add](#) ([LinkedListNode](#) * node_) [virtual]

Add the linked list node to this linked list.

Parameters

node_	Pointer to the node to add
-----------------------	----------------------------

Implements [LinkedList](#).

Reimplemented in [ThreadList](#).

Definition at line 102 of file [ll.cpp](#).

13.5.2.2 void [CircularLinkedList::Remove](#) ([LinkedListNode](#) * node_) [virtual]

Add the linked list node to this linked list.

Parameters

node_	Pointer to the node to remove
-----------------------	-------------------------------

Implements [LinkedList](#).

Reimplemented in [ThreadList](#).

Definition at line 127 of file [ll.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/ll.h](#)
- [/home/moslevin/m3/embedded/stage/src/ll.cpp](#)

13.6 CommandLine_t Struct Reference

Structure containing multiple representations for command-line data.

```
#include <shell_support.h>
```

Public Attributes

- [Token_t](#) * [pastTokenList](#)
Pointer to the list of tokens in the commandline.
- K_UCHAR [ucTokenCount](#)
Count of tokens in the token list.
- [Token_t](#) * [pstCommand](#)
Pointer to the token corresponding to the shell command.
- [Option_t](#) [astOptions](#) [12]
Option structure array built from the token list.
- K_UCHAR [ucNumOptions](#)
Number of options parsed from the token list.

13.6.1 Detailed Description

Structure containing multiple representations for command-line data.

Definition at line 93 of file [shell_support.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/shell_support.h](#)

13.7 DCPU Class Reference

[DCPU](#) emulator, used for running code out of EEPROM, RAM, or other memory interfaces than FLASH.

```
#include <dcpu.h>
```

Public Member Functions

- void [Init](#) (K_USHORT *pusRAM_, K_USHORT usRAMSize_, const K_USHORT *pusROM_, K_USHORT usROMSize_)
Initialize the CPU emulator, specifying which driver supplies the memory read interface.
- void [RunOpcode](#) ()
Execute the next opcode at the VM's current PC.
- [DCPU_Registers](#) * [GetRegisters](#) ()
Return a pointer to the VM's register structure.
- void [SendInterrupt](#) (K_USHORT usMessage_)
Send an interrupt to the CPU with a given message.
- void [AddPlugin](#) ([DCPUPlugin](#) *pclPlugin_)
Add a plugin to the CPU.

Private Member Functions

- void **SET** ()
- void **ADD** ()
- void **SUB** ()
- void **MUL** ()
- void **MLI** ()
- void **DIV** ()
- void **DVI** ()
- void **MOD** ()
- void **MDI** ()
- void **AND** ()
- void **BOR** ()
- void **XOR** ()
- void **SHR** ()
- void **ASR** ()
- void **SHL** ()
- bool **IFB** ()
- bool **IFC** ()
- bool **IFE** ()
- bool **IFN** ()
- bool **IFG** ()
- bool **IFA** ()
- bool **IFL** ()
- bool **IFU** ()
- void **ADX** ()
- void **SBX** ()
- void **STI** ()
- void **STD** ()
- void **JSR** ()
- void **INT** ()
- void **IAG** ()
- void **IAS** ()
- void **RFI** ()
- void **IAQ** ()
- void **HWN** ()
- void **HWQ** ()
- void **HWI** ()
- K_UCHAR **GetOperand** (K_UCHAR ucOpType_, K_USHORT **pusResult_)
- void **ProcessInterruptQueue** ()

Process the next interrupt in the Queue.

Private Attributes

- **DCPU_Registers m_stRegisters**
CPU Register file.
- K_USHORT * **a**
Temporary "a" operand pointer.
- K_USHORT * **b**
Temporary "b" operand pointer.
- K_USHORT **m_usTempA**
Local-storage for staging literal "a" values.
- K_USHORT * **m_pusRAM**

- Pointer to the RAM buffer.*
- K_USHORT [m_usRAMSize](#)
Size to the RAM (including stack)
- K_USHORT * [m_pusROM](#)
Pointer to the CPU ROM storage.
- K_USHORT [m_usROMSize](#)
Size of the ROM.
- K_ULONG [m_ulCycleCount](#)
Current cycle count.
- K_BOOL [m_bInterruptQueueing](#)
CPU flag indicating whether or not interrupts are queued.
- K_UCHAR [m_ucQueueLevel](#)
Current interrupt Queue level.
- K_USHORT [m_ausInterruptQueue](#) [8]
Interrupt queue.
- [DoubleLinkedList](#) [m_clPluginList](#)
Linked-list of plug-ins.

13.7.1 Detailed Description

[DCPU](#) emulator, used for running code out of EEPROM, RAM, or other memory interfaces than FLASH.

Definition at line 359 of file [dcpu.h](#).

13.7.2 Member Function Documentation

13.7.2.1 void DCPU::AddPlugin (DCPUPlugin * *pclPlugin_*)

Add a plugin to the CPU.

Parameters

<i>pclPlugin_</i>	Pointer to the plugin object to add
-------------------	-------------------------------------

Definition at line 940 of file [dcpu.cpp](#).

13.7.2.2 K_UCHAR DCPU::GetOperand (K_UCHAR *ucOpType_*, K_USHORT ** *pusResult_*) [private]

Parameters

<i>ucOpType_</i>	The operand type, as specified in DCPU_Argument
<i>pusResult_</i>	Pointer to the pointer that corresponds to the argument's location in memory.

Definition at line 717 of file [dcpu.cpp](#).

13.7.2.3 DCPU_Registers * DCPU::GetRegisters () [inline]

Return a pointer to the VM's register structure.

Returns

Pointer to the VM's register structure

Definition at line 391 of file [dcpu.h](#).

13.7.2.4 void DCPU::HWN () [private]

Returns the number of connected hardware devices to "a"

Definition at line 637 of file [dcpu.cpp](#).

13.7.2.5 void DCPU::IAQ () [private]

Add an interrupt to the interrupt queue if non-zero, if a = 0 then interrupts will be triggered as normal

Interrupts queued

Interrupts triggered

Definition at line 619 of file [dcpu.cpp](#).

13.7.2.6 void DCPU::Init (K_USHORT * *pusRAM_*, K_USHORT *usRAMSize_*, const K_USHORT * *pusROM_*, K_USHORT *usROMSize_*)

Initialize the CPU emulator, specifying which driver supplies the memory read interface.

This allows us to abstract RAM/FLASH/EEPROM or other memory. The VM must be initialized before any other method in the class is run.

Parameters

<i>pusRAM_</i>	Pointer to the CPU's RAM buffer
<i>usRAMSize_</i>	Size of the RAM Buffer in words
<i>pusROM_</i>	Pointer to the CPU's ROM buffer
<i>usROMSize_</i>	Size of the ROM buffer in words

Definition at line 692 of file [dcpu.cpp](#).

13.7.2.7 void DCPU::RFI () [private]

Disables interrupt queueing, pop A from the stack, then pops PC from the stack. By disabling interrupt Queueing, we're essentially re-enabling interrupts.

Definition at line 604 of file [dcpu.cpp](#).

13.7.2.8 void DCPU::SendInterrupt (K_USHORT *usMessage_*)

Send an interrupt to the CPU with a given message.

Parameters

<i>usMessage_</i>	Message to send along with the interrupt
-------------------	----------------------------------------------------------

Definition at line 914 of file [dcpu.cpp](#).

13.7.3 Member Data Documentation

13.7.3.1 DoubleLinkedList DCPU::m_clPluginList [private]

Linked-list of plug-ins.

Definition at line 489 of file [dcpu.h](#).

The documentation for this class was generated from the following files:

- </home/moslevin/m3/embedded/stage/src/dcpu.h>
- </home/moslevin/m3/embedded/stage/src/dcpu.cpp>

13.8 DCPU_Registers Struct Reference

Structure defining the [DCPU](#) hardware registers.

```
#include <dcpu.h>
```

Public Attributes

- union {
 struct {
 K_USHORT **A**
 K_USHORT **B**
 K_USHORT **C**
 K_USHORT **X**
 K_USHORT **Y**
 K_USHORT **Z**
 K_USHORT **I**
 K_USHORT **J**
 K_USHORT **PC**
 K_USHORT **SP**
 K_USHORT **EX**
 K_USHORT **IA**
 }
 K_USHORT **ausRegisters** [12]
 };

13.8.1 Detailed Description

Structure defining the [DCPU](#) hardware registers.

Definition at line 72 of file [dcpu.h](#).

The documentation for this struct was generated from the following file:

- </home/moslevin/m3/embedded/stage/src/dcpu.h>

13.9 DCPUPugin Class Reference

Class used to provide the hardware device abstraction between the DCPU-16 emulator/VM and the host system.

```
#include <dcpu.h>
```

Inheritance diagram for DCPUPugin:

Public Member Functions

- void [Init](#) (K_USHORT usDeviceNumber_, K_ULONG ulHWID_, K_ULONG ulVID_, K_USHORT usVersion_, [DCPU_Callback](#) pfCallback_)
Initialize the [DCPU](#) plugin extension.
- void [Enumerate](#) ([DCPU_Registers](#) *pstRegisters_)
Perform hardware enumeration to the target VM specified by the register set.
- void [Interrupt](#) ([DCPU](#) *pciCPU_)
Execute the hardware callback.
- K_USHORT [GetDeviceNumber](#) ()
Return the device number associated with this plugin.

Private Attributes

- K_USHORT [m_usDeviceNumber](#)
Location of the device on the "bus".
- K_ULONG [m_ulHWID](#)
Hardware ID.
- K_ULONG [m_ulVID](#)
Vendor ID.
- K_USHORT [m_usVersion](#)
Hardware Version.
- [DCPU_Callback](#) [m_pfCallback](#)
HWI Callback.

Friends

- class [DCPUPluginList](#)

Additional Inherited Members

13.9.1 Detailed Description

Class used to provide the hardware device abstraction between the DCPU-16 emulator/VM and the host system.

Definition at line 267 of file [dcpu.h](#).

13.9.2 Member Function Documentation

13.9.2.1 void [DCPUPlugin::Enumerate](#) ([DCPU_Registers](#) * *pstRegisters_*) [inline]

Perform hardware enumeration to the target VM specified by the register set.

Parameters

<i>pstRegisters_</i>	Pointer to the VM's CPU registers, which are filled with enumeration data. See the DCPU 1.7 spec for details.
----------------------	-------------------------------------------------------------------------------------------------------------------------------

Definition at line 311 of file [dcpu.h](#).

13.9.2.2 K_USHORT DCPUPugin::GetDeviceNumber () [inline]

Return the device number associated with this plugin.

Returns

Device number associated with this plugin

Definition at line 339 of file [dcpu.h](#).

13.9.2.3 void DCPUPugin::Init (K_USHORT *usDeviceNumber_*, K_ULONG *ulHWID_*, K_ULONG *ulVID_*, K_USHORT *usVersion_*, DCPU_Callback *pfCallback_*) [inline]

Initialize the [DCPU](#) plugin extension.

Plug

Parameters

<i>usDevice-Number_</i>	Unique plugin device enumeration associated with this plugin
<i>ulHWID_</i>	Unique hardware type identifier
<i>ulVID_</i>	Hardware Vendor ID
<i>usVersion_</i>	Version identifier for this hardware piece
<i>pfCallback_</i>	Callback function invoked from the VM when a HWI instruction is called on this device. This is essentially the interrupt handler.

Definition at line 288 of file [dcpu.h](#).

13.9.2.4 void DCPUPugin::Interrupt (DCPU * *pclCPU_*) [inline]

Execute the hardware callback.

Parameters

<i>pclCPU_</i>	Pointer to the VM triggering the interrupt
----------------	--------------------------------------------

Definition at line 327 of file [dcpu.h](#).

The documentation for this class was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/dcpu.h](#)

13.10 DevNull Class Reference

This class implements the "default" driver (/dev/null)

Inheritance diagram for DevNull:

Public Member Functions

- virtual void [Init](#) ()
Initialize a driver, must be called prior to use.
- virtual K_UCHAR [Open](#) ()
Open a device driver prior to use.
- virtual K_UCHAR [Close](#) ()
Close a previously-opened device driver.
- virtual K_USHORT [Read](#) (K_USHORT usBytes_, K_UCHAR *pucData_)
Read a specified number of bytes from the device into a specific buffer.
- virtual K_USHORT [Write](#) (K_USHORT usBytes_, K_UCHAR *pucData_)
Write a payload of data of a given length to the device.
- virtual K_USHORT [Control](#) (K_USHORT usEvent_, void *pvDataIn_, K_USHORT usSizeIn_, void *pvDataOut_, K_USHORT usSizeOut_)
This is the main entry-point for device-specific io and control operations.

Additional Inherited Members

13.10.1 Detailed Description

This class implements the "default" driver (/dev/null)

Definition at line 40 of file [driver.cpp](#).

13.10.2 Member Function Documentation

13.10.2.1 virtual K_UCHAR DevNull::Close () [inline], [virtual]

Close a previously-opened device driver.

Returns

Driver-specific return code, 0 = OK, non-0 = error

Implements [Driver](#).

Definition at line 45 of file [driver.cpp](#).

13.10.2.2 virtual K_USHORT DevNull::Control (K_USHORT usEvent_, void * pvDataIn_, K_USHORT usSizeIn_, void * pvDataOut_, K_USHORT usSizeOut_) [inline], [virtual]

This is the main entry-point for device-specific io and control operations.

This is used for implementing all "side-channel" communications with a device, and any device-specific IO operations that do not conform to the typical POSIX read/write paradigm. Use of this function is analagous to the non-POSIX (yet still common) devctl() or ioctl().

Parameters

<i>usEvent_</i>	Code defining the io event (driver-specific)
<i>pvDataIn_</i>	Pointer to the input data
<i>usSizeIn_</i>	Size of the input data (in bytes)
<i>pvDataOut_</i>	Pointer to the output data
<i>usSizeOut_</i>	Size of the output data (in bytes)

Returns

Driver-specific return code, 0 = OK, non-0 = error

Implements [Driver](#).

Definition at line 53 of file [driver.cpp](#).

13.10.2.3 `virtual K_UCHAR DevNull::Open () [inline],[virtual]`

Open a device driver prior to use.

Returns

Driver-specific return code, 0 = OK, non-0 = error

Implements [Driver](#).

Definition at line 44 of file [driver.cpp](#).

13.10.2.4 `virtual K_USHORT DevNull::Read (K_USHORT usBytes_, K_UCHAR * pucData_) [inline],[virtual]`

Read a specified number of bytes from the device into a specific buffer.

Depending on the driver-specific implementation, this may be a number less than the requested number of bytes read, indicating that there there was less input than desired, or that as a result of buffering, the data may not be available.

Parameters

<i>usBytes_</i>	Number of bytes to read (<= size of the buffer)
<i>pucData_</i>	Pointer to a data buffer receiving the read data

Returns

Number of bytes actually read

Implements [Driver](#).

Definition at line 47 of file [driver.cpp](#).

13.10.2.5 `virtual K_USHORT DevNull::Write (K_USHORT usBytes_, K_UCHAR * pucData_) [inline],[virtual]`

Write a payload of data of a given length to the device.

Depending on the implementation of the driver, the amount of data written to the device may be less than the requested number of bytes. A result less than the requested size may indicate that the device buffer is full, indicating that the user must retry the write at a later point with the remaining data.

Parameters

<i>usBytes_</i>	Number of bytes to write (<= size of the buffer)
<i>pucData_</i>	Pointer to a data buffer containing the data to write

Returns

Number of bytes actually written

Implements [Driver](#).

Definition at line 50 of file [driver.cpp](#).

The documentation for this class was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/driver.cpp](#)

13.11 DoubleLinkedList Class Reference

Doubly-linked-list data type, inherited from the base [LinkedList](#) type.

```
#include <ll.h>
```

Inheritance diagram for DoubleLinkedList:

Public Member Functions

- [DoubleLinkedList](#) ()
Default constructor - initializes the head/tail nodes to NULL.
- virtual void [Add](#) ([LinkedListNode](#) *node_)
Add the linked list node to this linked list.
- virtual void [Remove](#) ([LinkedListNode](#) *node_)
Add the linked list node to this linked list.

Additional Inherited Members

13.11.1 Detailed Description

Doubly-linked-list data type, inherited from the base [LinkedList](#) type.

Definition at line 174 of file [ll.h](#).

13.11.2 Member Function Documentation

13.11.2.1 void [DoubleLinkedList::Add](#) ([LinkedListNode](#) * node_) [virtual]

Add the linked list node to this linked list.

Parameters

<i>node_</i>	Pointer to the node to add
--------------	----------------------------

Implements [LinkedList](#).

Definition at line 41 of file [ll.cpp](#).

13.11.2.2 void DoubleLinkedList::Remove (LinkedListNode * node_) [virtual]

Add the linked list node to this linked list.

Parameters

<i>node_</i>	Pointer to the node to remove
--------------	-------------------------------

Implements [LinkedList](#).

Definition at line 65 of file [ll.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/ll.h](#)
- [/home/moslevin/m3/embedded/stage/src/ll.cpp](#)

13.12 DrawBitmap_t Struct Reference

Defines a bitmap.

```
#include <draw.h>
```

Public Attributes

- K_USHORT [usX](#)
Leftmost pixel.
- K_USHORT [usY](#)
Uppermost pixel.
- K_USHORT [usWidth](#)
Width of the bitmap in pixels.
- K_USHORT [usHeight](#)
Height of the bitmap in pixels.
- K_UCHAR [ucBPP](#)
Bits-per-pixel.
- K_UCHAR * [pucData](#)
Pixel data pointer.

13.12.1 Detailed Description

Defines a bitmap.

Definition at line 117 of file [draw.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/draw.h](#)

13.13 DrawCircle_t Struct Reference

Defines a circle.

```
#include <draw.h>
```

Public Attributes

- K_USHORT [usX](#)
Center X pixel.
- K_USHORT [usY](#)
Center Y pixel.
- K_USHORT [usRadius](#)
Radius in pixels.
- COLOR [uLineColor](#)
Color of the circle perimeter.
- K_BOOL [bFill](#)
Whether or not to fill the interior of the circle.
- COLOR [uFillColor](#)
Fill color for the circle.

13.13.1 Detailed Description

Defines a circle.

Definition at line 92 of file [draw.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/draw.h](#)

13.14 DrawEllipse_t Struct Reference

Defines a ellipse.

```
#include <draw.h>
```

Public Attributes

- K_USHORT [usX](#)
Center X pixel.
- K_USHORT [usY](#)
Center Y pixel.
- K_USHORT [usHeight](#)
Height of the ellipse.
- K_USHORT [usWidth](#)
Width of the ellipse.
- COLOR [uColor](#)
Color of the ellipse perimeter.

13.14.1 Detailed Description

Defines a ellipse.

Definition at line 105 of file [draw.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/draw.h](#)

13.15 DrawLine_t Struct Reference

Defines a simple line.

```
#include <draw.h>
```

Public Attributes

- K_USHORT [usX1](#)
Starting X coordinate.
- K_USHORT [usX2](#)
Ending X coordinate.
- K_USHORT [usY1](#)
Starting Y Coordinate.
- K_USHORT [usY2](#)
Ending Y coordinate.
- COLOR [uColor](#)
Color of the pixel.

13.15.1 Detailed Description

Defines a simple line.

Definition at line 66 of file [draw.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/draw.h](#)

13.16 DrawMove_t Struct Reference

Simple 2D copy/paste.

```
#include <draw.h>
```

Public Attributes

- K_USHORT [usSrcX](#)
Source X pixel (leftmost)
- K_USHORT [usSrcY](#)
Source Y pixel (topmost)
- K_USHORT [usDstX](#)
Destination X pixel (leftmost)
- K_USHORT [usDstY](#)
Destination Y pixel (topmost)
- K_USHORT [usCopyHeight](#)
Number of rows to copy.
- K_USHORT [usCopyWidth](#)
Number of columns to copy.

13.16.1 Detailed Description

Simple 2D copy/paste.

Moves a bitmap specified by the given source coordinates on-surface to the destination coordinates.

Definition at line 172 of file [draw.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/draw.h](#)

13.17 DrawPoint_t Struct Reference

Defines a pixel.

```
#include <draw.h>
```

Public Attributes

- K_USHORT [usX](#)
X coordinate of the pixel.
- K_USHORT [usY](#)
Y coordinate of the pixel.
- COLOR [uColor](#)
Color of the pixel.

13.17.1 Detailed Description

Defines a pixel.

Definition at line 55 of file [draw.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/draw.h](#)

13.18 DrawPoly_t Struct Reference

Defines the structure of an arbitrary polygon.

```
#include <draw.h>
```

Public Attributes

- K_USHORT [usNumPoints](#)
Number of points in the polygon.
- COLOR [uColor](#)
Color to use for lines/fill.
- K_BOOL [bFill](#)
Display as wireframe or filled.
- [DrawVector_t](#) * [pstVector](#)
Vector points making the polygon.

13.18.1 Detailed Description

Defines the structure of an arbitrary polygon.

Can be used to specify the

Definition at line 199 of file [draw.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/draw.h](#)

13.19 DrawRectangle_t Struct Reference

Defines a rectangle.

```
#include <draw.h>
```

Public Attributes

- K_USHORT [usLeft](#)
Leftmost pixel of the rectangle.
- K_USHORT [usTop](#)
Topmost pixel of the rectangle.
- K_USHORT [usRight](#)
Rightmost pixel of the rectangle.
- K_USHORT [usBottom](#)
Bottom pixel of the rectangle.
- COLOR [uLineColor](#)
Color of the line.
- K_BOOL [bFill](#)
Whether or not to floodfill the interior.
- COLOR [uFillColor](#)
Color of the interior of the rectangle.

13.19.1 Detailed Description

Defines a rectangle.

Definition at line 78 of file [draw.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/draw.h](#)

13.20 DrawStamp_t Struct Reference

Defines a 1-bit 2D bitmap of arbitrary resolution.

```
#include <draw.h>
```

Public Attributes

- K_USHORT [usX](#)
Leftmost pixel.
- K_USHORT [usY](#)
Uppermost pixel.
- K_USHORT [usWidth](#)
Width of the stamp.
- K_USHORT [usHeight](#)
Height of the stamp.
- COLOR [uColor](#)
Color of the stamp.
- K_UCHAR * [pucData](#)
Pointer to the stamp data.

13.20.1 Detailed Description

Defines a 1-bit 2D bitmap of arbitrary resolution.

Definition at line [130](#) of file [draw.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/draw.h](#)

13.21 DrawText_t Struct Reference

Defines a bitmap-rendered string.

```
#include <draw.h>
```

Public Attributes

- K_USHORT [usLeft](#)
Leftmost pixel of the text.
- K_USHORT [usTop](#)
Uppermost pixel of the text.
- COLOR [uColor](#)
Color of the text.
- [Font_t](#) * [pstFont](#)
Pointer to the font used to render the text.
- const K_CHAR * [pcString](#)
ASCII String to render.

13.21.1 Detailed Description

Defines a bitmap-rendered string.

Definition at line [144](#) of file [draw.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/draw.h](#)

13.22 DrawVector_t Struct Reference

Specifies a single 2D point.

```
#include <draw.h>
```

Public Attributes

- K_USHORT **usX**
- K_USHORT **usY**

13.22.1 Detailed Description

Specifies a single 2D point.

When used in arrays, this provides a way to draw vector paths, which form the basis of the polygon data structures.

Definition at line 188 of file [draw.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/draw.h](#)

13.23 DrawWindow_t Struct Reference

Defines the active window - establishes boundaries for drawing on the current display.

```
#include <draw.h>
```

Public Attributes

- K_USHORT [usLeft](#)
Left boundary.
- K_USHORT [usRight](#)
Right boundary.
- K_USHORT [usTop](#)
Upper boundary.
- K_USHORT [usBottom](#)
Bottom boundary.

13.23.1 Detailed Description

Defines the active window - establishes boundaries for drawing on the current display.

Only pixels drawn inside the surface boundaries are rendered to the output

Definition at line 159 of file [draw.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/draw.h](#)

13.24 Driver Class Reference

Base device-driver class used in hardware abstraction.

```
#include <driver.h>
```

Inheritance diagram for Driver:

Public Member Functions

- virtual void **Init** ()=0
Initialize a driver, must be called prior to use.
- virtual K_UCHAR **Open** ()=0
Open a device driver prior to use.
- virtual K_UCHAR **Close** ()=0
Close a previously-opened device driver.
- virtual K_USHORT **Read** (K_USHORT usBytes_, K_UCHAR *pucData_)=0
Read a specified number of bytes from the device into a specific buffer.
- virtual K_USHORT **Write** (K_USHORT usBytes_, K_UCHAR *pucData_)=0
Write a payload of data of a given length to the device.
- virtual K_USHORT **Control** (K_USHORT usEvent_, void *pvDataIn_, K_USHORT usSizeIn_, void *pvDataOut_, K_USHORT usSizeOut_)=0
This is the main entry-point for device-specific io and control operations.
- void **SetName** (const K_CHAR *pcName_)
Set the path for the driver.
- const K_CHAR * **GetPath** ()
Returns a string containing the device path.

Private Attributes

- const K_CHAR * **m_pcPath**
string pointer that holds the driver path (name)

Additional Inherited Members

13.24.1 Detailed Description

Base device-driver class used in hardware abstraction.

All other device drivers inherit from this class

Definition at line 121 of file [driver.h](#).

13.24.2 Member Function Documentation

13.24.2.1 K_UCHAR Driver::Close () [pure virtual]

Close a previously-opened device driver.

Returns

Driver-specific return code, 0 = OK, non-0 = error

Implemented in [DevNull](#).

13.24.2.2 K_USHORT Driver::Control (K_USHORT *usEvent_*, void * *pvDataIn_*, K_USHORT *usSizeIn_*, void * *pvDataOut_*, K_USHORT *usSizeOut_*) [pure virtual]

This is the main entry-point for device-specific io and control operations.

This is used for implementing all "side-channel" communications with a device, and any device-specific IO operations that do not conform to the typical POSIX read/write paradigm. Use of this function is analagous to the non-POSIX (yet still common) `devctl()` or `ioctl()`.

Parameters

<i>usEvent_</i>	Code defining the io event (driver-specific)
<i>pvDataIn_</i>	Pointer to the input data
<i>usSizeIn_</i>	Size of the input data (in bytes)
<i>pvDataOut_</i>	Pointer to the output data
<i>usSizeOut_</i>	Size of the output data (in bytes)

Returns

Driver-specific return code, 0 = OK, non-0 = error

Implemented in [DevNull](#).

13.24.2.3 const K_CHAR * Driver::GetPath () [inline]

Returns a string containing the device path.

Returns

`pcName_` Return the string constant representing the device path

Definition at line [231](#) of file [driver.h](#).

13.24.2.4 K_UCHAR Driver::Open () [pure virtual]

Open a device driver prior to use.

Returns

Driver-specific return code, 0 = OK, non-0 = error

Implemented in [DevNull](#).

13.24.2.5 K_USHORT Driver::Read (K_USHORT *usBytes_*, K_UCHAR * *pucData_*) [pure virtual]

Read a specified number of bytes from the device into a specific buffer.

Depending on the driver-specific implementation, this may be a number less than the requested number of bytes read, indicating that there was less input than desired, or that as a result of buffering, the data may not be available.

Parameters

<i>usBytes_</i>	Number of bytes to read (<= size of the buffer)
<i>pucData_</i>	Pointer to a data buffer receiving the read data

Returns

Number of bytes actually read

Implemented in [DevNull](#).

13.24.2.6 void Driver::SetName (const K_CHAR * *pcName_*) [inline]

Set the path for the driver.

Name must be set prior to access (since driver access is name-based).

Parameters

<i>pcName_</i>	String constant containing the device path
----------------	--------------------------------------------

Definition at line 222 of file [driver.h](#).

13.24.2.7 K_USHORT Driver::Write (K_USHORT *usBytes_*, K_UCHAR * *pucData_*) [pure virtual]

Write a payload of data of a given length to the device.

Depending on the implementation of the driver, the amount of data written to the device may be less than the requested number of bytes. A result less than the requested size may indicate that the device buffer is full, indicating that the user must retry the write at a later point with the remaining data.

Parameters

<i>usBytes_</i>	Number of bytes to write (<= size of the buffer)
<i>pucData_</i>	Pointer to a data buffer containing the data to write

Returns

Number of bytes actually written

Implemented in [DevNull](#).

The documentation for this class was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/driver.h](#)

13.25 DriverList Class Reference

List of [Driver](#) objects used to keep track of all device drivers in the system.

```
#include <driver.h>
```

Static Public Member Functions

- static void [Init](#) ()
Initialize the list of drivers.
- static void [Add](#) ([Driver](#) *pclDriver_)
Add a [Driver](#) object to the managed global driver-list.
- static void [Remove](#) ([Driver](#) *pclDriver_)
Remove a driver from the global driver list.
- static [Driver](#) * [FindByPath](#) (const K_CHAR *m_pcPath)
Look-up a driver in the global driver-list based on its path.

Static Private Attributes

- static [DoubleLinkedList](#) [m_clDriverList](#)
LinkedList object used to implementing the driver object management.

13.25.1 Detailed Description

List of [Driver](#) objects used to keep track of all device drivers in the system.

By default, the list contains a single entity, "/dev/null".

Definition at line 244 of file [driver.h](#).

13.25.2 Member Function Documentation

13.25.2.1 [DriverList::Add](#) ([Driver](#) * *pcDriver_*) [inline], [static]

Add a [Driver](#) object to the managed global driver-list.

Parameters

<i>pcDriver_</i>	pointer to the driver object to add to the global driver list.
------------------	----------------------------------------------------------------

Definition at line 264 of file [driver.h](#).

13.25.2.2 [Driver](#) * [DriverList::FindByPath](#) (const K_CHAR * *m_pcPath*) [static]

Look-up a driver in the global driver-list based on its path.

In the event that the driver is not found in the list, a pointer to the default "/dev/null" object is returned. In this way, unimplemented drivers are automatically stubbed out.

Definition at line 97 of file [driver.cpp](#).

13.25.2.3 void [DriverList::Init](#) () [static]

Initialize the list of drivers.

Must be called prior to using the device driver library.

Definition at line 88 of file [driver.cpp](#).

13.25.2.4 void DriverList::Remove (Driver * *pcDriver_*) [inline],[static]

Remove a driver from the global driver list.

Parameters

<i>pcDriver_</i>	Pointer to the driver object to remove from the global table
------------------	--------------------------------------------------------------

Definition at line 274 of file [driver.h](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/driver.h](#)
- [/home/moslevin/m3/embedded/stage/src/driver.cpp](#)

13.26 FixedHeap Class Reference

Fixed-size-block heap allocator with multiple block sizes.

```
#include <fixed_heap.h>
```

Public Member Functions

- void [Create](#) (void *pvHeap_, [HeapConfig](#) *pclHeapConfig_)
Creates a heap in a provided blob of memory with lists of fixed-size blocks configured based on the associated configuration data.
- void * [Alloc](#) (K_USHORT usSize_)
Allocate a blob of memory from the heap.

Static Public Member Functions

- static void [Free](#) (void *pvNode_)
Free a previously-allocated block of memory to the heap it was originally allocated from.

Private Attributes

- [HeapConfig](#) * [m_paclHeaps](#)
Pointer to the configuration data used by the heap.

13.26.1 Detailed Description

Fixed-size-block heap allocator with multiple block sizes.

Definition at line 104 of file [fixed_heap.h](#).

13.26.2 Member Function Documentation

13.26.2.1 void * FixedHeap::Alloc (K_USHORT usSize_)

Allocate a blob of memory from the heap.

If no appropriately-sized data block is available, will return NULL. Note, this API is thread- safe, and interrupt safe.

Parameters

<i>usSize_</i>	Size (in bytes) to allocate from the heap
----------------	-------------------------------------------

Returns

Pointer to a block of data allocated, or 0 on error.

Definition at line 130 of file [fixed_heap.cpp](#).

13.26.2.2 void FixedHeap::Create (void * *pvHeap_*, HeapConfig * *pclHeapConfig_*)

Creates a heap in a provided blob of memory with lists of fixed-size blocks configured based on the associated configuration data.

A heap must be created before it can be allocated/freed.

Parameters

<i>pvHeap_</i>	Pointer to the data blob that will contain the heap
<i>pclHeapConfig_</i>	Pointer to the array of config objects that define how the heap is laid out in memory, and how many blocks of what size are included. The objects in the array must be initialized, starting from smallest block-size to largest, with the final entry in the table have a 0-block size, indicating end-of-configuration.

Definition at line 113 of file [fixed_heap.cpp](#).

13.26.2.3 void FixedHeap::Free (void * *pvNode_*) [static]

Free a previously-allocated block of memory to the heap it was originally allocated from.

This must point to the block of memory at its originally-returned pointer, and not an address within an allocated blob (as supported by some allocators).

Parameters

<i>pvNode_</i>	Pointer to the previously-allocated block of memory
----------------	-----------------------------------------------------

Definition at line 160 of file [fixed_heap.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/fixed_heap.h](#)
- [/home/moslevin/m3/embedded/stage/src/fixed_heap.cpp](#)

13.27 Font_t Struct Reference

Public Attributes

- K_UCHAR **ucSize**
- K_UCHAR **ucFlags**

13.28 GamePanelControl Class Reference

Inheritance diagram for GamePanelControl:

Public Member Functions

- virtual void [Init](#) ()
Initialiize the control - must be called before use.
- virtual void [Draw](#) ()
Redraw the control "cleanly".
- virtual [GuiReturn_t ProcessEvent](#) ([GuiEvent_t](#) *pstEvent_)
Process an event sent to the control.
- virtual void [Activate](#) (bool bActivate_)
Activate or deactivate the current control - used when switching from one active control to another.

Private Attributes

- [JoystickEvent_t m_stLastJoy](#)
- [JoystickEvent_t m_stCurrentJoy](#)

Additional Inherited Members

13.28.1 Detailed Description

Definition at line 32 of file [control_gamepanel.h](#).

13.28.2 Member Function Documentation

13.28.2.1 virtual void [GamePanelControl::Activate](#) (bool *bActivate_*) [inline], [virtual]

Activate or deactivate the current control - used when switching from one active control to another.

Parameters

<i>bActivate_</i>	- true to activate, false to deactivate
-------------------	-----------------------------------------

Implements [GuiControl](#).

Definition at line 38 of file [control_gamepanel.h](#).

13.28.2.2 void GamePanelControl::Draw () [virtual]

Redraw the control "cleanly".

Subclass specific.

Implements [GuiControl](#).

Definition at line 27 of file [control_gamepanel.cpp](#).

13.28.2.3 virtual void GamePanelControl::Init () [inline],[virtual]

Initialiize the control - must be called before use.

Implementation is subclass specific.

Implements [GuiControl](#).

Definition at line 35 of file [control_gamepanel.h](#).

13.28.2.4 GuiReturn_t GamePanelControl::ProcessEvent (GuiEvent_t * *pstEvent_*) [virtual]

Process an event sent to the control.

Subclass specific implementation.

Parameters

<i>pstEvent_</i>	Pointer to a struct containing the event data
------------------	-----------------------------------------------

Implements [GuiControl](#).

Definition at line 33 of file [control_gamepanel.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/control_gamepanel.h](#)
- [/home/moslevin/m3/embedded/stage/src/control_gamepanel.cpp](#)

13.29 GlobalMessagePool Class Reference

Implements a list of message objects shared between all threads.

```
#include <message.h>
```

Static Public Member Functions

- static void [Init](#) ()
Initialize the message queue prior to use.
- static void [Push](#) ([Message](#) *pclMessage_)
Return a previously-claimed message object back to the global queue.
- static [Message](#) * [Pop](#) ()
Pop a message from the global queue, returning it to the user to be populated before sending by a transmitter.

Static Private Attributes

- static [Message m_aclMessagePool](#) [GLOBAL_MESSAGE_POOL_SIZE]
Array of message objects that make up the message pool.
- static [DoubleLinkedList m_clList](#)
Linked list used to manage the [Message](#) objects.

13.29.1 Detailed Description

Implements a list of message objects shared between all threads.

Definition at line 157 of file [message.h](#).

13.29.2 Member Function Documentation

13.29.2.1 [Message * GlobalMessagePool::Pop \(\)](#) [static]

Pop a message from the global queue, returning it to the user to be populated before sending by a transmitter.

Returns

Pointer to a [Message](#) object

Definition at line 69 of file [message.cpp](#).

13.29.2.2 [void GlobalMessagePool::Push \(Message * pclMessage_ \)](#) [static]

Return a previously-claimed message object back to the global queue.

Used once the message has been processed by a receiver.

Parameters

pclMessage_	Pointer to the Message object to return back to the global queue
-----------------------------	----------------------------------------------------------------------------------

Definition at line 57 of file [message.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/message.h](#)
- [/home/moslevin/m3/embedded/stage/src/message.cpp](#)

13.30 Glyph_t Struct Reference

Public Attributes

- K_UCHAR [ucWidth](#)
Width of this font glyph in pixels.
- K_UCHAR [ucHeight](#)
Height of this font glyph in pixels.
- K_UCHAR [ucVOffset](#)
Vertical offset of this glyph.
- K_UCHAR [aucData](#) [1]
Glyph data array.

13.30.1 Detailed Description

Definition at line 26 of file [font.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/font.h](#)

13.31 GraphicsDriver Class Reference

Defines the base graphics driver class, which is inherited by all other graphics drivers.

```
#include <graphics.h>
```

Inheritance diagram for GraphicsDriver:

Public Member Functions

- virtual void [DrawPixel](#) ([DrawPoint_t](#) *pstPoint_)
Draw a single pixel to the display.
- virtual void [ReadPixel](#) ([DrawPoint_t](#) *pstPoint_)
Read a single pixel from the display.
- virtual void [ClearScreen](#) ()
Clear the screen (initializes to all black pixels)
- virtual void [Point](#) ([DrawPoint_t](#) *pstPoint_)
Draw a pixel to the display.
- virtual void [Line](#) ([DrawLine_t](#) *pstLine_)
Draw a line to the display using Bresenham's line drawing algorithm.
- virtual void [Rectangle](#) ([DrawRectangle_t](#) *pstRectangle_)
Draws a rectangle on the display.
- virtual void [Circle](#) ([DrawCircle_t](#) *pstCircle_)
Draw a circle to the display.
- virtual void [Ellipse](#) ([DrawEllipse_t](#) *pstEllipse_)
Draw an ellipse to the display.
- virtual void [Bitmap](#) ([DrawBitmap_t](#) *pstBitmap_)
Draw an RGB image on the display.
- virtual void [Stamp](#) ([DrawStamp_t](#) *pstStamp_)
Draws a stamp (a 1-bit bitmap) on the display.
- virtual void [Move](#) ([DrawMove_t](#) *pstMove_)
Move a the contents from one rectangle on screen to another rectangle, specified by the values of the input structure.
- virtual void [TriangleWire](#) ([DrawPoly_t](#) *pstPoly_)
Draw a wireframe triangle to the display.
- virtual void [TriangleFill](#) ([DrawPoly_t](#) *pstPoly_)
Draw a filled triangle to the display.

- virtual void **Polygon** ([DrawPoly_t](#) *pstPoly_)
- virtual void **Text** ([DrawText_t](#) *pstText_)

Draw a string of text to the display using a bitmap font.
- virtual K_USHORT **TextWidth** ([DrawText_t](#) *pstText_)
- void **SetWindow** ([DrawWindow_t](#) *pstWindow_)

Set the drawable window of the screen.
- void **ClearWindow** ()

Clear the window - resetting the boundaries to the entire drawable area of the screen.

Protected Attributes

- K_USHORT **m_usResX**
- K_USHORT **m_usResY**
- K_USHORT **m_usLeft**
- K_USHORT **m_usTop**
- K_USHORT **m_usRight**
- K_USHORT **m_usBottom**
- K_UCHAR **m_ucBPP**

Additional Inherited Members

13.31.1 Detailed Description

Defines the base graphics driver class, which is inherited by all other graphics drivers.

Per-pixel rendering functions for all raster operations is provided by default. These can be overridden with more efficient hardware-supported operations where available.

Definition at line 32 of file [graphics.h](#).

13.31.2 Member Function Documentation

13.31.2.1 void GraphicsDriver::Bitmap ([DrawBitmap_t](#) * *pstBitmap_*) [virtual]

Draw an RGB image on the display.

Parameters

<i>pstBitmap_</i>	- pointer to the bitmap object to display
-------------------	-------------------------------------------

Definition at line 300 of file [graphics.cpp](#).

13.31.2.2 void GraphicsDriver::Circle ([DrawCircle_t](#) * *pstCircle_*) [virtual]

Draw a circle to the display.

Parameters

<i>pstCircle_</i>	- pointer to the circle to draw
-------------------	---------------------------------

Definition at line 176 of file [graphics.cpp](#).

13.31.2.3 void GraphicsDriver::DrawPixel (DrawPoint_t * *pstPoint_*) [inline],[virtual]

Draw a single pixel to the display.

Parameters

<i>pstPoint_</i>	Structure containing the pixel data (color/location) to be written.
------------------	---------------------------------------------------------------------

Definition at line 49 of file [graphics.h](#).

13.31.2.4 void GraphicsDriver::Ellipse (DrawEllipse_t * *pstEllipse_*) [virtual]

Draw an ellipse to the display.

Parameters

<i>pstEllipse_</i>	- pointer to the ellipse to draw on the display
--------------------	-------------------------------------------------

Definition at line 248 of file [graphics.cpp](#).

13.31.2.5 void GraphicsDriver::Line (DrawLine_t * *pstLine_*) [virtual]

Draw a line to the display using Bresenham's line drawing algorithm.

Parameters

<i>pstLine_</i>	- pointer to the line structure
-----------------	---------------------------------

Definition at line 48 of file [graphics.cpp](#).

13.31.2.6 void GraphicsDriver::Move (DrawMove_t * *pstMove_*) [virtual]

Move a the contents from one rectangle on screen to another rectangle, specified by the values of the input structure.

Parameters

<i>pstMove_</i>	- object describing the graphics movement operation (framebuffer operations only).
-----------------	------------------------------------------------------------------------------------

Definition at line 438 of file [graphics.cpp](#).

13.31.2.7 void GraphicsDriver::Point (DrawPoint_t * *pstPoint_*) [virtual]

Draw a pixel to the display.

Parameters

<i>pstPoint_</i>	- pointer to the struct containing the pixel to draw
------------------	------------------------------------------------------

Definition at line 42 of file [graphics.cpp](#).

13.31.2.8 void GraphicsDriver::ReadPixel (DrawPoint_t * *pstPoint_*) [inline],[virtual]

Read a single pixel from the display.

Parameters

<i>pstPoint_</i>	Structure containing the pixel location of the pixel to be read. The color value will contain the value from the display when read.
------------------	-------------------------------------------------------------------------------------------------------------------------------------

Definition at line 58 of file [graphics.h](#).

13.31.2.9 void GraphicsDriver::Rectangle (DrawRectangle_t * *pstRectangle_*) [virtual]

Draws a rectangle on the display.

Parameters

<i>pstRectangle_</i>	- pointer to the rectangle struct
----------------------	-----------------------------------

Definition at line 131 of file [graphics.cpp](#).

13.31.2.10 void GraphicsDriver::SetWindow (DrawWindow_t * *pstWindow_*)

Set the drawable window of the screen.

Parameters

<i>pstWindow_</i>	- pointer to the window struct defining the drawable area
-------------------	-----------------------------------------------------------

Definition at line 882 of file [graphics.cpp](#).

13.31.2.11 void GraphicsDriver::Stamp (DrawStamp_t * *pstStamp_*) [virtual]

Draws a stamp (a 1-bit bitmap) on the display.

Parameters

<i>pstStamp_</i>	- pointer to the stamp object to draw
------------------	---------------------------------------

Definition at line 399 of file [graphics.cpp](#).

13.31.2.12 void GraphicsDriver::Text (DrawText_t * *pstText_*) [virtual]

Draw a string of text to the display using a bitmap font.

Parameters

<i>pstText_</i>	- pointer to the text object to render
-----------------	----------------------------------------

Definition at line 499 of file [graphics.cpp](#).

13.31.2.13 void GraphicsDriver::TriangleFill (DrawPoly_t * *pstPoly_*) [virtual]

Draw a filled triangle to the display.

Parameters

<i>pstPoly_</i>	Pointer to the polygon to draw.
-----------------	---------------------------------

Definition at line 655 of file [graphics.cpp](#).

13.31.2.14 void GraphicsDriver::TriangleWire (DrawPoly_t * *pstPoly_*) [virtual]

Draw a wireframe triangle to the display.

Parameters

<i>pstPoly_</i>	Pointer to the polygon to draw.
-----------------	---------------------------------

Definition at line 630 of file [graphics.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/graphics.h](#)
- [/home/moslevin/m3/embedded/stage/src/graphics.cpp](#)

13.32 GroupBoxControl Class Reference

Inheritance diagram for GroupBoxControl:

Public Member Functions

- virtual void [Init](#) ()
Initialiize the control - must be called before use.
- virtual void [Draw](#) ()
Redraw the control "cleanly".
- virtual [GuiReturn_t](#) [ProcessEvent](#) ([GuiEvent_t](#) *pstEvent_)
Process an event sent to the control.
- virtual void [Activate](#) (bool bActivate_)
Activate or deactivate the current control - used when switching from one active control to another.
- void [SetPanelColor](#) (COLOR eColor_)
- void [SetLineColor](#) (COLOR eColor_)
- void [SetFontColor](#) (COLOR eColor_)
- void [SetFont](#) ([Font_t](#) *pstFont_)
- void [SetCaption](#) (const K_CHAR *pcCaption_)

Private Attributes

- COLOR [m_uPanelColor](#)
- COLOR [m_uLineColor](#)
- COLOR [m_uFontColor](#)
- [Font_t](#) * [m_pstFont](#)
- const K_CHAR * [m_pcCaption](#)

13.32.1 Detailed Description

Definition at line 29 of file [control_groupbox.h](#).

13.32.2 Member Function Documentation

13.32.2.1 `virtual void GroupBoxControl::Activate (bool bActivate_) [inline],[virtual]`

Activate or deactivate the current control - used when switching from one active control to another.

Parameters

<i>bActivate_</i>	- true to activate, false to deactivate
-------------------	-----------------------------------------

Implements [GuiControl](#).

Definition at line 38 of file [control_groupbox.h](#).

13.32.2.2 `void GroupBoxControl::Draw () [virtual]`

Redraw the control "cleanly".

Subclass specific.

Implements [GuiControl](#).

Definition at line 30 of file [control_groupbox.cpp](#).

13.32.2.3 `virtual void GroupBoxControl::Init () [inline],[virtual]`

Initialiize the control - must be called before use.

Implementation is subclass specific.

Implements [GuiControl](#).

Definition at line 32 of file [control_groupbox.h](#).

13.32.2.4 `virtual GuiReturn_t GroupBoxControl::ProcessEvent (GuiEvent_t * pstEvent_) [inline],[virtual]`

Process an event sent to the control.

Subclass specific implementation.

Parameters

<i>pstEvent_</i>	Pointer to a struct containing the event data
------------------	-----------------------------------------------

Implements [GuiControl](#).

Definition at line 37 of file [control_groupbox.h](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/control_groupbox.cpp](#)

13.33 GuiControl Class Reference

GUI Control Base Class.

```
#include <gui.h>
```

Inheritance diagram for GuiControl:

Public Member Functions

- virtual void **Init** ()=0
Initialize the control - must be called before use.
- virtual void **Draw** ()=0
Redraw the control "cleanly".
- virtual **GuiReturn_t ProcessEvent** (**GuiEvent_t** *pstEvent_)=0
Process an event sent to the control.
- void **SetTop** (K_USHORT usTop_)
Set the location of the topmost pixel of the control.
- void **SetLeft** (K_USHORT usLeft_)
Set the location of the leftmost pixel of the control.
- void **SetHeight** (K_USHORT usHeight_)
Set the height of the control (in pixels)
- void **SetWidth** (K_USHORT usWidth_)
Set the width of the control (in pixels)
- void **SetZOrder** (K_UCHAR ucZ_)

- Set the Z-order (depth) of the control.*
 - void [SetControlIndex](#) (K_UCHAR ucIdx_)
 - Set the index of the control, used for cycling through focus (ala tab order in VB).*
 - K_USHORT [GetTop](#) ()
 - Return the topmost pixel of the control.*
 - K_USHORT [GetLeft](#) ()
 - Return the leftmost pixel of the control.*
 - K_USHORT [GetHeight](#) ()
 - Get the height of the control in pixels.*
 - K_USHORT [GetWidth](#) ()
 - Get the width of the control in pixels.*
 - K_UCHAR [GetZOrder](#) ()
 - Return the Z-order of the control.*
 - K_UCHAR [GetControlIndex](#) ()
 - Return the Control Index of the control.*
 - K_BOOL [IsStale](#) ()
 - Return whether or not the control needs to be redrawn or not.*
 - void [GetControlOffset](#) (K_USHORT *pusX_, K_USHORT *pusY_)
 - Return the absolute offset of the control within an event surface.*
 - K_BOOL [IsInFocus](#) ()
 - Return whether or not the current control has the focus in the window.*
 - virtual void [Activate](#) (bool bActivate_)=0
 - Activate or deactivate the current control - used when switching from one active control to another.*

Protected Member Functions

- void [SetParentControl](#) (GuiControl *pclParent_)
 - Set the parent control of this control.*
- void [SetParentWindow](#) (GuiWindow *pclWindow_)
 - Set the parent window of this control.*
- GuiControl * [GetParentControl](#) ()
 - Return the pointer to the control's currently-assigned parent control.*
- GuiWindow * [GetParentWindow](#) ()
 - Get the parent window of this control.*
- void [ClearStale](#) ()
 - Clear the stale flag for this control.*
- void [SetStale](#) ()
 - Signal that the object needs to be redrawn.*
- void [SetAcceptFocus](#) (bool bFocus_)
 - Tell the control whether or not to accept focus.*
- bool [AcceptsFocus](#) ()
 - Returns whether or not this control accepts focus.*

Private Attributes

- K_BOOL [m_bStale](#)
 - true if the control is stale and needs to be redrawn, false otherwise*
- K_BOOL [m_bAcceptsFocus](#)
 - Whether or not the control accepts focus or not.*
- K_UCHAR [m_ucZOrder](#)

- The Z-Order (depth) of the control.*
- K_UCHAR [m_ucControlIndex](#)
Index of the control in the window.
- K_USHORT [m_usTop](#)
Topmost location of the control on the window.
- K_USHORT [m_usLeft](#)
Leftmost location of the control on the window.
- K_USHORT [m_usWidth](#)
Width of the control in pixels.
- K_USHORT [m_usHeight](#)
Height of the control in pixels.
- [GuiControl](#) * [m_pclParentControl](#)
Pointer to the parent control.
- [GuiWindow](#) * [m_pclParentWindow](#)
Pointer to the parent window associated with this control.

13.33.1 Detailed Description

GUI Control Base Class.

This class is the common ancestor to all GUI control elements. It defines a base set of properties common to all controls, as well as methods for initialization, event handling, and redrawing. Controls are directly related to Windows, which are used to manage and organize controls.

Definition at line 538 of file [gui.h](#).

13.33.2 Member Function Documentation

13.33.2.1 void GuiControl::Activate (bool *bActivate_*) [pure virtual]

Activate or deactivate the current control - used when switching from one active control to another.

Parameters

<i>bActivate_</i>	- true to activate, false to deactivate
-------------------	-----------------------------------------

Implemented in [StubControl](#), [NotificationControl](#), [LabelControl](#), [ButtonControl](#), [PanelControl](#), [SlickButtonControl](#), [GamePanelControl](#), [GroupBoxControl](#), [ProgressControl](#), [SlickProgressControl](#), [CheckBoxControl](#), and [SlickGroupBoxControl](#).

13.33.2.2 void GuiControl::ClearStale () [inline], [protected]

Clear the stale flag for this control.

Should only be done after a redraw has been completed

Definition at line 741 of file [gui.h](#).

13.33.2.3 void GuiControl::Draw () [pure virtual]

Redraw the control "cleanly".

Subclass specific.

Implemented in [StubControl](#), [NotificationControl](#), [LabelControl](#), [ButtonControl](#), [PanelControl](#), [SlickButtonControl](#), [GamePanelControl](#), [GroupBoxControl](#), [ProgressControl](#), [SlickProgressControl](#), [CheckBoxControl](#), and [SlickGroupBoxControl](#).

13.33.2.4 K_UCHAR GuiControl::GetControlIndex () [inline]

Return the Control Index of the control.

Returns

The control index of the control

Definition at line 648 of file [gui.h](#).

13.33.2.5 void GuiControl::GetControlOffset (K_USHORT * pusX_, K_USHORT * pusY_)

Return the absolute offset of the control within an event surface.

This function will traverse through all of the object's parents, and their parents, until the root control and root window are identified. The absolute pixel locations of the Topmost (Y) and Leftmost (X) pixels are populated in the

Parameters

<i>pusX_</i>	Pointer to the K_USHORT containing the leftmost pixel
<i>pusY_</i>	Pointer to the K_USHORT containing the topmost pixel

Definition at line 669 of file [gui.cpp](#).

13.33.2.6 K_USHORT GuiControl::GetHeight () [inline]

Get the height of the control in pixels.

Returns

Height of the control in pixels

Definition at line 627 of file [gui.h](#).

13.33.2.7 K_USHORT GuiControl::GetLeft () [inline]

Return the leftmost pixel of the control.

Returns

Leftmost pixel of the control

Definition at line 620 of file [gui.h](#).

13.33.2.8 GuiControl * GuiControl::GetParentControl () [inline], [protected]

Return the pointer to the control's currently-assigned parent control.

Returns

Pointer to the Control's currently assigned parent control.

Definition at line 725 of file [gui.h](#).

13.33.2.9 GuiWindow * GuiControl::GetParentWindow () [inline], [protected]

Get the parent window of this control.

Returns

Pointer to the control's window

Definition at line 733 of file [gui.h](#).

13.33.2.10 K_USHORT GuiControl::GetTop () [inline]

Return the topmost pixel of the control.

Returns

Topmost pixel of the control

Definition at line 613 of file [gui.h](#).

13.33.2.11 K_USHORT GuiControl::GetWidth () [inline]

Get the width of the control in pixels.

Returns

Width of the control in pixels

Definition at line 634 of file [gui.h](#).

13.33.2.12 K_UCHAR GuiControl::GetZOrder () [inline]

Return the Z-order of the control.

Returns

Z-order of the control

Definition at line 641 of file [gui.h](#).

13.33.2.13 void GuiControl::Init () [pure virtual]

Initialiize the control - must be called before use.

Implementation is subclass specific.

Implemented in [StubControl](#), [ButtonControl](#), [PanelControl](#), [SlickButtonControl](#), [GamePanelControl](#), [LabelControl](#), [NotificationControl](#), [ProgressControl](#), [SlickProgressControl](#), [CheckBoxControl](#), [GroupBoxControl](#), and [SlickGroupBoxControl](#).

13.33.2.14 `K_BOOL GuiControl::IsInFocus () [inline]`

Return whether or not the current control has the focus in the window.

Returns

true if this control is in focus, false otherwise

Definition at line 677 of file [gui.h](#).

13.33.2.15 `K_BOOL GuiControl::IsStale () [inline]`

Return whether or not the control needs to be redrawn or not.

Returns

true - control needs redrawing, false - control is intact.

Definition at line 655 of file [gui.h](#).

13.33.2.16 `GuiReturn_t GuiControl::ProcessEvent (GuiEvent_t* pstEvent_) [pure virtual]`

Process an event sent to the control.

Subclass specific implementation.

Parameters

<i>pstEvent_</i>	Pointer to a struct containing the event data
------------------	-----------------------------------------------

Implemented in [StubControl](#), [NotificationControl](#), [LabelControl](#), [ButtonControl](#), [PanelControl](#), [SlickButtonControl](#), [GamePanelControl](#), [GroupBoxControl](#), [ProgressControl](#), [SlickProgressControl](#), [CheckBoxControl](#), and [SlickGroupBoxControl](#).

13.33.2.17 `void GuiControl::SetControllIndex (K_UCHAR ucIdx_) [inline]`

Set the index of the control, used for cycling through focus (ala tab order in VB).

Parameters

<i>ucIdx_</i>	Focus index of the control
---------------	----------------------------

Definition at line 606 of file [gui.h](#).

13.33.2.18 `void GuiControl::SetHeight (K_USHORT usHeight_) [inline]`

Set the height of the control (in pixels)

Parameters

<i>usHeight_</i>	Height of the control in pixels
------------------	---------------------------------

Definition at line 584 of file [gui.h](#).

13.33.2.19 void GuiControl::SetLeft (K_USHORT *usLeft_*) [inline]

Set the location of the leftmost pixel of the control.

Parameters

<i>usLeft_</i>	Leftmost pixel of the control
----------------	-------------------------------

Definition at line 577 of file [gui.h](#).

13.33.2.20 void GuiControl::SetParentControl (GuiControl * *pclParent_*) [inline], [protected]

Set the parent control of this control.

When a control has its parent set, it is considered "nested" within that control. Moving the control will thus result in all of its child controls to become invalidated, thus requiring redraws. The control's object offsets (Top, Bottom, Height, and Width) also become relative to the origin of the parent control.

Parameters

<i>pclParent_</i>	Pointer to the control's parent control
-------------------	-----------------------------------------

Definition at line 706 of file [gui.h](#).

13.33.2.21 void GuiControl::SetParentWindow (GuiWindow * *pclWindow_*) [inline], [protected]

Set the parent window of this control.

All controls within the same window are all associated together, and share events targetted towards a specific window. Event tabbing, focus, and Z-ordering is also shared between controls within a window.

Parameters

<i>pclWindow_</i>	Pointer to the control's parent window.
-------------------	-----------------------------------------

Definition at line 717 of file [gui.h](#).

13.33.2.22 void GuiControl::SetTop (K_USHORT *usTop_*) [inline]

Set the location of the topmost pixel of the control.

Parameters

<i>usTop_</i>	Topmost pixel of the control
---------------	------------------------------

Definition at line 570 of file [gui.h](#).

13.33.2.23 void GuiControl::SetWidth (K_USHORT *usWidth_*) [inline]

Set the width of the control (in pixels)

Parameters

<i>usWidth_</i>	Width of the control in pixels
-----------------	--------------------------------

Definition at line 591 of file [gui.h](#).

13.33.2.24 void GuiControl::SetZOrder (K_UCHAR ucZ_) [inline]

Set the Z-order (depth) of the control.

Parameters

<i>ucZ_</i>	Z order of the control
-------------	------------------------

Definition at line 598 of file [gui.h](#).

13.33.3 Member Data Documentation

13.33.3.1 K_UCHAR GuiControl::m_ucControlIndex [private]

Index of the control in the window.

This is used for setting focus when transitioning from control to control on a window

Definition at line 770 of file [gui.h](#).

13.33.3.2 K_UCHAR GuiControl::m_ucZOrder [private]

The Z-Order (depth) of the control.

Only the highest order controls are visible at any given location

Definition at line 766 of file [gui.h](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/gui.h](#)
- [/home/moslevin/m3/embedded/stage/src/gui.cpp](#)

13.34 GuiEvent_t Struct Reference

Composite UI event structure.

```
#include <gui.h>
```

Public Attributes

- K_UCHAR [ucEventType](#)
GuiEventType_t event type.
- K_UCHAR [ucTargetID](#)
Control index that this event is targeted towards.
- union {
[KeyEvent_t stKey](#)
Keyboard data.
[MouseEvent_t stMouse](#)
Mouse data.
[TouchEvent_t stTouch](#)
Touchscreen data.
[JoystickEvent_t stJoystick](#)
Joystick data.
[TimerEvent_t stTimer](#)
Timer data.
};

13.34.1 Detailed Description

Composite UI event structure.

Depending on the event type, can contain either a keyboard, mouse, touch, joystick, timer event, etc.

Definition at line 187 of file [gui.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/gui.h](#)

13.35 GuiEventSurface Class Reference

GUI Event Surface Object.

```
#include <gui.h>
```

Public Member Functions

- void [Init](#) ()
Initialize an event surface before use.
- void [AddWindow](#) ([GuiWindow](#) *pclWindow_)
Add a window to the event surface.
- void [RemoveWindow](#) ([GuiWindow](#) *pclWindow_)
Remove a window from the event surface.
- K_BOOL [SendEvent](#) ([GuiEvent_t](#) *pstEvent_)
Send an event to this window surface.
- K_BOOL [ProcessEvent](#) ()
Process an event in the event queue.
- K_UCHAR [GetEventCount](#) ()
Get the count of pending events in the event surface's queue.
- [GuiWindow](#) * [FindWindowByName](#) (const K_CHAR *szName_)
Return a pointer to a window by name, or NULL on failure.
- void [InvalidateRegion](#) (K_USHORT usLeft_, K_USHORT usTop_, K_USHORT usWidth_, K_USHORT usHeight_)
Invalidate a region of the window, specified by the bounding box.

Private Member Functions

- void [CopyEvent](#) ([GuiEvent_t](#) *pstDst_, [GuiEvent_t](#) *pstSrc_)
Copy the contents of one message structure to another.

Private Attributes

- [DoubleLinkedList](#) [m_clWindowList](#)
List of windows managed on this event surface.
- [MessageQueue](#) [m_clMessageQueue](#)
Message queue used to manage window events.

13.35.1 Detailed Description

GUI Event Surface Object.

An event surface is the lowest-level UI object. It maintains a list of windows which are associated with it, and manages the transmission and routing of events to each window, and their appropriate controls

All windows located on the event surface are assumed to share a common display, and coordinate frame. In this way, multiple GUIs can be implemented in the system, each tied to separate physical or virtual displays.

Definition at line 452 of file [gui.h](#).

13.35.2 Member Function Documentation

13.35.2.1 void GuiEventSurface::AddWindow (GuiWindow * *pclWindow_*)

Add a window to the event surface.

Parameters

<i>pclWindow_</i>	Pointer to the window object to add to the sruface
-------------------	----------------------------------------------------

Definition at line 525 of file [gui.cpp](#).

13.35.2.2 void GuiEventSurface::CopyEvent (GuiEvent_t * *pstDst_*, GuiEvent_t * *pstSrc_*) [private]

Copy the contents of one message structure to another.

Parameters

<i>pstDst_</i>	Destination event pointer
<i>pstSrc_</i>	Source event pointer

Definition at line 645 of file [gui.cpp](#).

13.35.2.3 void GuiEventSurface::Init () [inline]

Initialize an event surface before use.

Must be called prior to any other object methods.

Definition at line 459 of file [gui.h](#).

13.35.2.4 void GuiEventSurface::InvalidateRegion (K_USHORT *usLeft_*, K_USHORT *usTop_*, K_USHORT *usWidth_*, K_USHORT *usHeight_*)

Invalidate a region of the window, specified by the bounding box.

The coordinates specified in the parameters (top and left) refer to absolute display coordinates, and are not relative to coordinates within a window.

Definition at line 658 of file [gui.cpp](#).

13.35.2.5 K_BOOL GuiEventSurface::ProcessEvent ()

Process an event in the event queue.

If no events are pending, the call will block until an event is available.

Definition at line 577 of file [gui.cpp](#).

13.35.2.6 void GuiEventSurface::RemoveWindow (GuiWindow * *pclWindow_*)

Remove a window from the event surface.

Parameters

<i>pclWindow_</i>	Pointer to the window object to remove from the surface
-------------------	---------------------------------------------------------

Definition at line 533 of file [gui.cpp](#).

13.35.2.7 K_BOOL GuiEventSurface::SendEvent (GuiEvent_t * *pstEvent_*)

Send an event to this window surface.

The event will be forwarded to all windows managed by this service.

Parameters

<i>pstEvent_</i>	Pointer to an event to send
------------------	-----------------------------

Returns

true on success, false on failure

Definition at line 541 of file [gui.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/gui.h](#)
- [/home/moslevin/m3/embedded/stage/src/gui.cpp](#)

13.36 GuiWindow Class Reference

Basic Window Class.

```
#include <gui.h>
```

Inheritance diagram for GuiWindow:

Public Member Functions

- void [Init](#) ()
Initialize the GUI Window object prior to use.
- void [SetDriver](#) ([GraphicsDriver](#) **pclDriver_*)
Set the graphics driver to use for rendering controls on the window.
- [GraphicsDriver](#) * [GetDriver](#) ()
Set the graphics driver to use for rendering controls on the window.
- void [AddControl](#) ([GuiControl](#) **pclControl_*, [GuiControl](#) **pclParent_*)
Assign a GUI Control to this window object.

- void [RemoveControl](#) ([GuiControl](#) *pclControl_)
Removes a previously-added control from the Window.
- K_UCHAR [GetMaxZOrder](#) ()
Returns the highest Z-Order of all controls attached to this window.
- void [Redraw](#) (K_BOOL bRedrawAll_)
Redraw objects in the window.
- void [ProcessEvent](#) ([GuiEvent_t](#) *pstEvent_)
Process an event sent to this window.
- void [SetFocus](#) ([GuiControl](#) *pclControl_)
Set the control used to accept "focus" events.
- K_BOOL [IsInFocus](#) ([GuiControl](#) *pclControl_)
Return whether or not the selected control is in focus or not.
- void [SetTop](#) (K_USHORT usTop_)
Set the location of the topmost pixel of the window.
- void [SetLeft](#) (K_USHORT usLeft_)
Set the location of the leftmost pixel of the window.
- void [SetHeight](#) (K_USHORT usHeight_)
Set the height of the window (in pixels)
- void [SetWidth](#) (K_USHORT usWidth_)
Set the width of the window (in pixels)
- K_USHORT [GetTop](#) ()
Return the topmost pixel of the window.
- K_USHORT [GetLeft](#) ()
Return the leftmost pixel of the window.
- K_USHORT [GetHeight](#) ()
Get the height of the window in pixels.
- K_USHORT [GetWidth](#) ()
Get the width of the window in pixels.
- K_UCHAR [GetZOrder](#) ()
Get the Z-order of the window on the event surface.
- void [SetZOrder](#) (K_UCHAR ucZ_)
Set the Z-order of the window on the event surface.
- void [CycleFocus](#) (bool bForward_)
Cycle the focus to the next active control in the window.
- void [SetName](#) (const K_CHAR *szName_)
Set the name for this window.
- const K_CHAR * [GetName](#) ()
Return the name of this window.
- void [InvalidateRegion](#) (K_USHORT usLeft_, K_USHORT usTop_, K_USHORT usWidth_, K_USHORT usHeight_)
Invalidate a region of the window, specified by the bounding box.

Private Attributes

- K_USHORT [m_usTop](#)
Topmost pixel of the window on the event surface.
- K_USHORT [m_usLeft](#)
Leftmost pixel of the window on the event surface.
- K_USHORT [m_usHeight](#)
Height of the window in pixels.

- K_USHORT [m_usWidth](#)
Width of the window in pixels.
- K_UCHAR [m_ucZ](#)
Z-order of the window on the event surface.
- const K_CHAR * [m_szName](#)
Name applied to this window.
- [DoubleLinkedList](#) [m_clControlList](#)
List of controls managed by this window.
- [GuiControl](#) * [m_pclInFocus](#)
Pointer to the control in event focus.
- K_UCHAR [m_ucControlCount](#)
Number of controls in this window.
- [GraphicsDriver](#) * [m_pclDriver](#)
Graphics driver for this window.

Additional Inherited Members

13.36.1 Detailed Description

Basic Window Class.

A Window is loosely defined as a container of controls, all sharing a coordinate reference coordinate frame. Events are managed on a per-window basis, and each window is isolated from eachother.

Definition at line 223 of file [gui.h](#).

13.36.2 Member Function Documentation

13.36.2.1 GuiWindow::AddControl ([GuiControl](#) * *pclControl_*, [GuiControl](#) * *pclParent_*)

Assign a GUI Control to this window object.

Adding an object to a window ensures that the object will be drawn on the specific window surface, and ensures that events directed to this window will be forwarded to the controls appropriately.

Parameters

<i>pclControl_</i>	Pointer to the control object to add
<i>pclParent_</i>	Pointer to the control's "parent" object (or NULL)

Definition at line 27 of file [gui.cpp](#).

13.36.2.2 void GuiWindow::CycleFocus ([bool](#) *bForward_*)

Cycle the focus to the next active control in the window.

Parameters

<i>bForward_</i>	- Cycle to the next control when true, previous control when false
------------------	--------------------------------------------------------------------

Definition at line 395 of file [gui.cpp](#).

13.36.2.3 GraphicsDriver * GuiWindow::GetDriver () [inline]

Set the graphics driver to use for rendering controls on the window.

Returns

Pointer to the Window's graphics driver

Definition at line 252 of file [gui.h](#).

13.36.2.4 K_USHORT GuiWindow::GetHeight () [inline]

Get the height of the window in pixels.

Returns

Height of the window in pixels

Definition at line 379 of file [gui.h](#).

13.36.2.5 K_USHORT GuiWindow::GetLeft () [inline]

Return the leftmost pixel of the window.

Returns

Leftmost pixel of the window

Definition at line 372 of file [gui.h](#).

13.36.2.6 K_UCHAR GuiWindow::GetMaxZOrder ()

Returns the highest Z-Order of all controls attached to this window.

Returns

The highest Z-Order used by controls in this window

Definition at line 61 of file [gui.cpp](#).

13.36.2.7 K_USHORT GuiWindow::GetTop () [inline]

Return the topmost pixel of the window.

Returns

Topmost pixel of the window

Definition at line 365 of file [gui.h](#).

13.36.2.8 K_USHORT GuiWindow::GetWidth () [inline]

Get the width of the window in pixels.

Returns

Width of the window in pixels

Definition at line 386 of file [gui.h](#).

13.36.2.9 void GuiWindow::Init () [inline]

Initialize the GUI Window object prior to use.

Must be called before calling other methods on this object

Definition at line 231 of file [gui.h](#).

13.36.2.10 void GuiWindow::InvalidateRegion (K_USHORT *usLeft_*, K_USHORT *usTop_*, K_USHORT *usWidth_*, K_USHORT *usHeight_*)

Invalidate a region of the window, specified by the bounding box.

The coordinates specified in the parameters (top and left) refer to absolute display coordinates, and are not relative to coordinates within a window.

Definition at line 127 of file [gui.cpp](#).

13.36.2.11 K_BOOL GuiWindow::IsInFocus (GuiControl * *pclControl_*) [inline]

Return whether or not the selected control is in focus or not.

Parameters

<i>pclControl_</i>	Pointer to the control object to evaluate
--------------------	-------------------------------------------

Returns

true - the selected control is the active control on the window false - otherwise

Definition at line 323 of file [gui.h](#).

13.36.2.12 void GuiWindow::ProcessEvent (GuiEvent_t * *pstEvent_*)

Process an event sent to this window.

This method handles all of the plumbing required to target the event towards specific controls, or all controls in the window depending on the event payload.

Definition at line 245 of file [gui.cpp](#).

13.36.2.13 void GuiWindow::Redraw (K_BOOL *bRedrawAll_*)

Redraw objects in the window.

Typically, only the affected controls will need to be redrawn, but in some cases (such as window initialization), the entire window will need to be redrawn cleanly. This behavior is defined by the value of the *bRedrawAll_* parameter.

Definition at line 85 of file [gui.cpp](#).

13.36.2.14 GuiWindow::RemoveControl (GuiControl * *pclControl_*)

Removes a previously-added control from the Window.

Parameters

<i>pclControl_</i>	Pointer to the control object to remove
--------------------	-----------------------------------------

Definition at line 40 of file [gui.cpp](#).

13.36.2.15 void GuiWindow::SetDriver (GraphicsDriver * *pclDriver_*) [inline]

Set the graphics driver to use for rendering controls on the window.

Parameters

<i>pclDriver_</i>	Pointer to the graphics driver
-------------------	--------------------------------

Definition at line 244 of file [gui.h](#).

13.36.2.16 void GuiWindow::SetFocus (GuiControl * *pclControl_*)

Set the control used to accept "focus" events.

Such events include keyboard events.

Parameters

<i>pclControl_</i>	Pointer to the control object to set focus on.
--------------------	------------------------------------------------

Definition at line 387 of file [gui.cpp](#).

13.36.2.17 void GuiWindow::SetHeight (K_USHORT *usHeight_*) [inline]

Set the height of the window (in pixels)

Parameters

<i>usHeight_</i>	Height of the window in pixels
------------------	--------------------------------

Definition at line 351 of file [gui.h](#).

13.36.2.18 void GuiWindow::SetLeft (K_USHORT *usLeft_*) [inline]

Set the location of the leftmost pixel of the window.

Parameters

<i>usLeft_</i>	Leftmost pixel of the window
----------------	------------------------------

Definition at line 344 of file [gui.h](#).

13.36.2.19 void GuiWindow::SetTop (K_USHORT *usTop_*) [inline]

Set the location of the topmost pixel of the window.

Parameters

<i>usTop_</i>	Topmost pixel of the window
---------------	-----------------------------

Definition at line 337 of file [gui.h](#).

13.36.2.20 void GuiWindow::SetWidth (K_USHORT *usWidth_*) [inline]

Set the width of the window (in pixels)

Parameters

<code>usWidth_</code>	Width of the window in pixels
-----------------------	-------------------------------

Definition at line 358 of file [gui.h](#).

13.36.3 Member Data Documentation

13.36.3.1 GraphicsDriver* GuiWindow::m_pclDriver [private]

Graphics driver for this window.

Definition at line 436 of file [gui.h](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/gui.h](#)
- [/home/moslevin/m3/embedded/stage/src/gui.cpp](#)

13.37 HeapConfig Class Reference

Heap configuration object.

```
#include <fixed_heap.h>
```

Public Attributes

- K_USHORT [m_usBlockSize](#)
Block size in bytes.
- K_USHORT [m_usBlockCount](#)
Number of blocks to create @ this size.

Protected Attributes

- [BlockHeap m_clHeap](#)
BlockHeap object used by the allocator.

Friends

- class **FixedHeap**

13.37.1 Detailed Description

Heap configuration object.

Definition at line 90 of file [fixed_heap.h](#).

The documentation for this class was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/fixed_heap.h](#)

13.38 JoystickEvent_t Struct Reference

Joystick UI event structure.

```
#include <gui.h>
```

Public Attributes

- union {
 - K_USHORT [usRawData](#)
Raw joystick data.
 - struct {
 - unsigned int [bUp](#):1
D-pad UP state.
 - unsigned int [bDown](#):1
D-pad DOWN state.
 - unsigned int [bLeft](#):1
D-pad LEFT state.
 - unsigned int [bRight](#):1
D-pad RIGHT state.
 - unsigned int [bButton1](#):1
Joystick Button1 state.
 - unsigned int [bButton2](#):1
Joystick Button2 state.
 - unsigned int [bButton3](#):1
Joystick Button3 state.
 - unsigned int [bButton4](#):1
Joystick Button4 state.
 - unsigned int [bButton5](#):1
Joystick Button5 state.
 - unsigned int [bButton6](#):1
Joystick Button6 state.
 - unsigned int [bButton7](#):1
Joystick Button7 state.
 - unsigned int [bButton8](#):1
Joystick Button8 state.
 - unsigned int [bButton9](#):1
Joystick Button9 state.
 - unsigned int [bButton10](#):1
Joystick Button10 state.
 - unsigned int [bSelect](#):1
Start button state.
 - unsigned int [bStart](#):1
Select button state.

```
};
```

13.38.1 Detailed Description

Joystick UI event structure.

Definition at line [144](#) of file [gui.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/gui.h](#)

13.39 Kernel Class Reference

Class that encapsulates all of the kernel startup functions.

```
#include <kernel.h>
```

Static Public Member Functions

- static void [Init](#) (void)
Kernel Initialization Function, call before any other OS function.
- static void [Start](#) (void)
Start the kernel; function never returns.
- static bool [IsStarted](#) ()
IsStarted.
- static void [SetPanic](#) (panic_func_t pfPanic_)
SetPanic Set a function to be called when a kernel panic occurs, giving the user to determine the behavior when a catastrophic failure is observed.
- static bool [IsPanic](#) ()
IsPanic Returns whether or not the kernel is in a panic state.
- static void [Panic](#) (K_USHORT usCause_)
Panic Cause the kernel to enter its panic state.

Static Private Attributes

- static bool [m_bIsStarted](#)
true if kernel is running, false otherwise
- static bool [m_bIsPanic](#)
true if kernel is in panic state, false otherwise
- static panic_func_t [m_pfPanic](#)
user-set panic function

13.39.1 Detailed Description

Class that encapsulates all of the kernel startup functions.

Definition at line 42 of file [kernel.h](#).

13.39.2 Member Function Documentation

13.39.2.1 Kernel::Init (void) [static]

[Kernel](#) Initialization Function, call before any other OS function.

Initializes all global resources used by the operating system. This must be called before any other kernel function is invoked.

Definition at line 47 of file [kernel.cpp](#).

13.39.2.2 static bool Kernel::IsPanic () [inline],[static]

IsPanic Returns whether or not the kernel is in a panic state.

Returns

Whether or not the kernel is in a panic state

Definition at line 89 of file [kernel.h](#).

13.39.2.3 `static bool Kernel::IsStarted () [inline],[static]`

IsStarted.

Returns

Whether or not the kernel has started - true = running, false = not started

Definition at line 74 of file [kernel.h](#).

13.39.2.4 `void Kernel::Panic (K_USHORT usCause_) [static]`

Panic Cause the kernel to enter its panic state.

Parameters

<i>usCause_</i>	Reason for the kernel panic
-----------------	-----------------------------

Definition at line 86 of file [kernel.cpp](#).

13.39.2.5 `static void Kernel::SetPanic (panic_func_t pfPanic_) [inline],[static]`

SetPanic Set a function to be called when a kernel panic occurs, giving the user to determine the behavior when a catastrophic failure is observed.

Parameters

<i>pfPanic_</i>	Panic function pointer
-----------------	------------------------

Definition at line 83 of file [kernel.h](#).

13.39.2.6 `Kernel::Start (void) [static]`

Start the kernel; function never returns.

Start the operating system kernel - the current execution context is cancelled, all kernel services are started, and the processor resumes execution at the entrypoint for the highest-priority thread.

You must have at least one thread added to the kernel before calling this function, otherwise the behavior is undefined.

Definition at line 76 of file [kernel.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/kernel.h](#)
- [/home/moslevin/m3/embedded/stage/src/kernel.cpp](#)

13.40 KernelSWI Class Reference

Class providing the software-interrupt required for context-switching in the kernel.

```
#include <kernelswi.h>
```

Static Public Member Functions

- static void [Config](#) (void)
Configure the software interrupt - must be called before any other software interrupt functions are called.
- static void [Start](#) (void)
Enable ("Start") the software interrupt functionality.
- static void [Stop](#) (void)
Disable the software interrupt functionality.
- static void [Clear](#) (void)
Clear the software interrupt.
- static void [Trigger](#) (void)
Call the software interrupt.
- static K_UCHAR [DI](#) ()
Disable the SWI flag itself.
- static void [RI](#) (K_UCHAR bEnable_)
Restore the state of the SWI to the value specified.

13.40.1 Detailed Description

Class providing the software-interrupt required for context-switching in the kernel.

Definition at line 32 of file [kernelswi.h](#).

13.40.2 Member Function Documentation

13.40.2.1 K_UCHAR KernelSWI::DI () [static]

Disable the SWI flag itself.

Returns

previous status of the SWI, prior to the DI call

Definition at line 50 of file [kernelswi.cpp](#).

13.40.2.2 void KernelSWI::RI (K_UCHAR bEnable_) [static]

Restore the state of the SWI to the value specified.

Parameters

<i>bEnable_</i>	true - enable the SWI, false - disable SWI
-----------------	--------------------------------------------

Definition at line 58 of file [kernelswi.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/kernelswi.h](#)
- [/home/moslevin/m3/embedded/stage/src/kernelswi.cpp](#)

13.41 KernelTimer Class Reference

Hardware timer interface, used by all scheduling/timer subsystems.

```
#include <kerneltimer.h>
```

Static Public Member Functions

- static void [Config](#) (void)
Initializes the kernel timer before use.
- static void [Start](#) (void)
Starts the kernel time (must be configured first)
- static void [Stop](#) (void)
Shut down the kernel timer, used when no timers are scheduled.
- static K_UCHAR [DI](#) (void)
Disable the kernel timer's expiry interrupt.
- static void [RI](#) (K_UCHAR bEnable_)
Restore the state of the kernel timer's expiry interrupt.
- static void [EI](#) (void)
Enable the kernel timer's expiry interrupt.
- static K_ULONG [SubtractExpiry](#) (K_ULONG ulInterval_)
Subtract the specified number of ticks from the timer's expiry count register.
- static K_ULONG [TimeToExpiry](#) (void)
Returns the number of ticks remaining before the next timer expiry.
- static K_ULONG [SetExpiry](#) (K_ULONG ulInterval_)
Resets the kernel timer's expiry interval to the specified value.
- static K_ULONG [GetOvertime](#) (void)
Return the number of ticks that have elapsed since the last expiry.
- static void [ClearExpiry](#) (void)
Clear the hardware timer expiry register.

Static Private Member Functions

- static K_USHORT [Read](#) (void)
Safely read the current value in the timer register.

13.41.1 Detailed Description

Hardware timer interface, used by all scheduling/timer subsystems.

Definition at line 33 of file [kerneltimer.h](#).

13.41.2 Member Function Documentation

13.41.2.1 K_ULONG KernelTimer::GetOvertime (void) [static]

Return the number of ticks that have elapsed since the last expiry.

Returns

Number of ticks that have elapsed after last timer expiration

Definition at line 94 of file [kerneltimer.cpp](#).

13.41.2.2 K_USHORT KernelTimer::Read (void) [static], [private]

Safely read the current value in the timer register.

Returns

Value held in the timer register

Definition at line 57 of file [kerneltimer.cpp](#).

13.41.2.3 void KernelTimer::RI (K_UCHAR bEnable_) [static]

Retstore the state of the kernel timer's expiry interrupt.

Parameters

<i>bEnable_</i>	1 enable, 0 disable
-----------------	---------------------

Definition at line 137 of file [kerneltimer.cpp](#).

13.41.2.4 K_ULONG KernelTimer::SetExpiry (K_ULONG ulInterval_) [static]

Resets the kernel timer's expiry interval to the specified value.

Parameters

<i>ulInterval_</i>	Desired interval in ticks to set the timer for
--------------------	------------------------------------------------

Returns

Actual number of ticks set (may be less than desired)

Definition at line 100 of file [kerneltimer.cpp](#).

13.41.2.5 K_ULONG KernelTimer::SubtractExpiry (K_ULONG ulInterval_) [static]

Subtract the specified number of ticks from the timer's expiry count register.

Returns the new expiry value stored in the register.

Parameters

<i>ulInterval_</i>	Time (in HW-specific) ticks to subtract
--------------------	-----------------------------------------

Returns

Value in ticks stored in the timer's expiry register

Definition at line 71 of file [kerneltimer.cpp](#).

13.41.2.6 K_ULONG KernelTimer::TimeToExpiry (void) [static]

Returns the number of ticks remaining before the next timer expiry.

Returns

Time before next expiry in platform-specific ticks

Definition at line 78 of file [kerneltimer.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/kerneltimer.h](#)
- [/home/moslevin/m3/embedded/stage/src/kerneltimer.cpp](#)

13.42 KeyEvent_t Struct Reference

Keyboard UI event structure definition.

```
#include <gui.h>
```

Public Attributes

- K_UCHAR [ucKeyCode](#)
8-bit value representing a keyboard scan code
- union {
 K_UCHAR [ucFlags](#)
 Flags indicating modifiers to the event.
 struct {
 unsigned int [bKeyState](#):1
 Key is being pressed or released.
 unsigned int [bShiftState](#):1
 Whether or not shift is pressed.
 unsigned int [bCtrlState](#):1
 Whether or not CTRL is pressed.
 unsigned int [bAltState](#):1
 Whether or not ALT is pressed.
 unsigned int [bWinState](#):1
 Whether or not the Window/Clover key is pressed.
 unsigned int [bFnState](#):1
 Whether or not a special function key is pressed.
 }
};

13.42.1 Detailed Description

Keyboard UI event structure definition.

Definition at line 80 of file [gui.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/gui.h](#)

13.43 LabelControl Class Reference

Inheritance diagram for LabelControl:

Public Member Functions

- virtual void [Init](#) ()
Initialize the control - must be called before use.
- virtual void [Draw](#) ()
Redraw the control "cleanly".
- virtual [GuiReturn_t](#) [ProcessEvent](#) ([GuiEvent_t](#) *pstEvent_)
Process an event sent to the control.
- virtual void [Activate](#) (bool bActivate_)
Activate or deactivate the current control - used when switching from one active control to another.
- void [SetBackColor](#) (COLOR eColor_)
- void [SetFontColor](#) (COLOR eColor_)
- void [SetFont](#) ([Font_t](#) *pstFont_)
- void [SetCaption](#) (const K_CHAR *pcData_)

Private Attributes

- [Font_t](#) * [m_pstFont](#)
- const K_CHAR * [m_pcCaption](#)
- COLOR [m_uBackColor](#)
- COLOR [m_uFontColor](#)

Additional Inherited Members

13.43.1 Detailed Description

Definition at line 30 of file [control_label.h](#).

13.43.2 Member Function Documentation

13.43.2.1 virtual void LabelControl::Activate (bool *bActivate_*) [inline],[virtual]

Activate or deactivate the current control - used when switching from one active control to another.

Parameters

<i>bActivate_</i>	- true to activate, false to deactivate
-------------------	-----------------------------------------

Implements [GuiControl](#).

Definition at line 40 of file [control_label.h](#).

13.43.2.2 void LabelControl::Draw () [virtual]

Redraw the control "cleanly".

Subclass specific.

Implements [GuiControl](#).

Definition at line 26 of file [control_label.cpp](#).

13.43.2.3 virtual void LabelControl::Init () [inline],[virtual]

Initialiize the control - must be called before use.

Implementation is subclass specific.

Implements [GuiControl](#).

Definition at line 33 of file [control_label.h](#).

13.43.2.4 virtual GuiReturn_t LabelControl::ProcessEvent (GuiEvent_t * pstEvent_) [inline],[virtual]

Process an event sent to the control.

Subclass specific implementation.

Parameters

<i>pstEvent_</i>	Pointer to a struct containing the event data
------------------	-----------------------------------------------

Implements [GuiControl](#).

Definition at line 39 of file [control_label.h](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/control_label.h](#)
- [/home/moslevin/m3/embedded/stage/src/control_label.cpp](#)

13.44 LinkList Class Reference

Abstract-data-type from which all other linked-lists are derived.

```
#include <ll.h>
```

Inheritance diagram for LinkList:

Public Member Functions

- void [Init](#) ()
Clear the linked list.

- virtual void [Add](#) ([LinkedListNode](#) *node_)=0
Add the linked list node to this linked list.
- virtual void [Remove](#) ([LinkedListNode](#) *node_)=0
Add the linked list node to this linked list.
- [LinkedListNode](#) * [GetHead](#) ()
Get the head node in the linked list.
- [LinkedListNode](#) * [GetTail](#) ()
Get the tail node of the linked list.

Protected Attributes

- [LinkedListNode](#) * [m_pstHead](#)
Pointer to the head node in the list.
- [LinkedListNode](#) * [m_pstTail](#)
Pointer to the tail node in the list.

13.44.1 Detailed Description

Abstract-data-type from which all other linked-lists are derived.

Definition at line 121 of file [ll.h](#).

13.44.2 Member Function Documentation

13.44.2.1 void [LinkedList::Add](#) ([LinkedListNode](#) * node_) [pure virtual]

Add the linked list node to this linked list.

Parameters

node_	Pointer to the node to add
-----------------------	----------------------------

Implemented in [CircularLinkedList](#), [DoubleLinkedList](#), and [ThreadList](#).

13.44.2.2 [LinkedListNode](#) * [LinkedList::GetHead](#) () [inline]

Get the head node in the linked list.

Returns

Pointer to the head node in the list

Definition at line 158 of file [ll.h](#).

13.44.2.3 [LinkedListNode](#) * [LinkedList::GetTail](#) () [inline]

Get the tail node of the linked list.

Returns

Pointer to the tail node in the list

Definition at line 167 of file [ll.h](#).

13.44.2.4 `void LinkList::Remove (LinkListNode * node_)` [pure virtual]

Add the linked list node to this linked list.

Parameters

<code>node_</code>	Pointer to the node to remove
--------------------	-------------------------------

Implemented in [CircularLinkList](#), [DoubleLinkList](#), and [ThreadList](#).

The documentation for this class was generated from the following file:

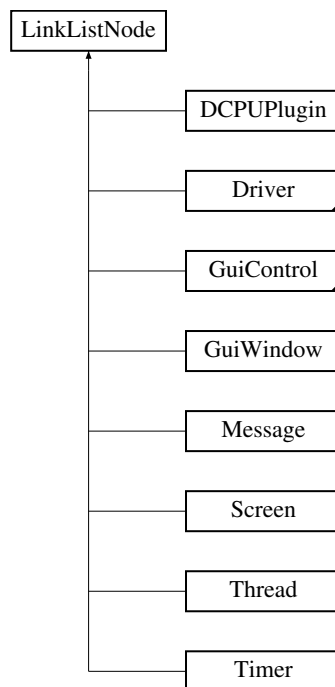

- [/home/moslevin/m3/embedded/stage/src/ll.h](#)

13.45 LinkListNode Class Reference

Basic linked-list node data structure.

```
#include <ll.h>
```

Inheritance diagram for LinkListNode:

Public Member Functions

- `LinkListNode * GetNext (void)`
Returns a pointer to the next node in the list.
- `LinkListNode * GetPrev (void)`
Returns a pointer to the previous node in the list.

Protected Member Functions

- `void ClearNode ()`
Initialize the linked list node, clearing its next and previous node.

Protected Attributes

- [LinkedListNode](#) * `next`
Pointer to the next node in the list.
- [LinkedListNode](#) * `prev`
Pointer to the previous node in the list.

Friends

- class **LinkedList**
- class **DoubleLinkedList**
- class **CircularLinkedList**

13.45.1 Detailed Description

Basic linked-list node data structure.

This data is managed by the linked-list class types, and can be used transparently between them.

Definition at line 77 of file [ll.h](#).

13.45.2 Member Function Documentation

13.45.2.1 [LinkedListNode](#) * [LinkedListNode::GetNext](#) (void) [\[inline\]](#)

Returns a pointer to the next node in the list.

Returns

a pointer to the next node in the list.

Definition at line 101 of file [ll.h](#).

13.45.2.2 [LinkedListNode](#) * [LinkedListNode::GetPrev](#) (void) [\[inline\]](#)

Returns a pointer to the previous node in the list.

Returns

a pointer to the previous node in the list.

Definition at line 110 of file [ll.h](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/ll.h](#)
- [/home/moslevin/m3/embedded/stage/src/ll.cpp](#)

13.46 MemUtil Class Reference

String and Memory manipulation class.

```
#include <memutil.h>
```

Static Public Member Functions

- static void [DecimalToHex](#) (K_UCHAR ucData_, char *szText_)
Convert an 8-bit unsigned binary value as a hexadecimal string.
- static void **DecimalToHex** (K_USHORT usData_, char *szText_)
- static void **DecimalToHex** (K_ULONG ulData_, char *szText_)
- static void [DecimalToString](#) (K_UCHAR ucData_, char *szText_)
Convert an 8-bit unsigned binary value as a decimal string.
- static void **DecimalToString** (K_USHORT usData_, char *szText_)
- static void **DecimalToString** (K_ULONG ulData_, char *szText_)
- static K_UCHAR [Checksum8](#) (const void *pvSrc_, K_USHORT usLen_)
Compute the 8-bit additive checksum of a memory buffer.
- static K_USHORT [Checksum16](#) (const void *pvSrc_, K_USHORT usLen_)
Compute the 16-bit additive checksum of a memory buffer.
- static K_USHORT [StringLength](#) (const char *szStr_)
Compute the length of a string in bytes.
- static bool [CompareStrings](#) (const char *szStr1_, const char *szStr2_)
Compare the contents of two zero-terminated string buffers to eachother.
- static void [CopyMemory](#) (void *pvDst_, const void *pvSrc_, K_USHORT usLen_)
Copy one buffer in memory into another.
- static void [CopyString](#) (char *szDst_, const char *szSrc_)
Copy a string from one buffer into another.
- static K_SHORT [StringSearch](#) (const char *szBuffer_, const char *szPattern_)
Search for the presence of one string as a substring within another.
- static bool [CompareMemory](#) (const void *pvMem1_, const void *pvMem2_, K_USHORT usLen_)
Compare the contents of two memory buffers to eachother.
- static void [SetMemory](#) (void *pvDst_, K_UCHAR ucVal_, K_USHORT usLen_)
Initialize a buffer of memory to a specified 8-bit pattern.
- static K_UCHAR [Tokenize](#) (const char *szBuffer_, [Token_t](#) *pastTokens_, K_UCHAR ucMaxTokens_)
Tokenize Function to tokenize a string based on a space delimiter.

13.46.1 Detailed Description

String and Memory manipulation class.

Utility method class implementing common memory and string manipulation functions, without relying on an external standard library implementation which might not be available on some toolchains, may be closed source, or may not be thread-safe.

Definition at line 47 of file [memutil.h](#).

13.46.2 Member Function Documentation

13.46.2.1 static K_USHORT MemUtil::Checksum16 (const void * *pvSrc_*, K_USHORT *usLen_*) [static]

Compute the 16-bit additive checksum of a memory buffer.

Parameters

<i>pvSrc_</i>	Memory buffer to compute a 16-bit checksum of.
<i>usLen_</i>	Length of the buffer in bytes.

Returns

16-bit checksum of the memory block.

Definition at line 215 of file [memutil.cpp](#).

13.46.2.2 `static K_USHORT MemUtil::Checksum8 (const void * pvSrc_, K_USHORT usLen_)` `[static]`

Compute the 8-bit additive checksum of a memory buffer.

Parameters

<i>pvSrc_</i>	Memory buffer to compute a 8-bit checksum of.
<i>usLen_</i>	Length of the buffer in bytes.

Returns

8-bit checksum of the memory block.

Definition at line 199 of file [memutil.cpp](#).

13.46.2.3 `static bool MemUtil::CompareMemory (const void * pvMem1_, const void * pvMem2_, K_USHORT usLen_)`
`[static]`

Compare the contents of two memory buffers to eachother.

Parameters

<i>pvMem1_</i>	First buffer to compare
<i>pvMem2_</i>	Second buffer to compare
<i>usLen_</i>	Length of buffer (in bytes) to compare

Returns

true if the buffers match, false if they do not.

Definition at line 342 of file [memutil.cpp](#).

13.46.2.4 `static bool MemUtil::CompareStrings (const char * szStr1_, const char * szStr2_)` `[static]`

Compare the contents of two zero-terminated string buffers to eachother.

Parameters

<i>szStr1_</i>	First string to compare
<i>szStr2_</i>	Second string to compare

Returns

true if strings match, false otherwise.

Definition at line 247 of file [memutil.cpp](#).

13.46.2.5 `static void MemUtil::CopyMemory (void * pvDst_, const void * pvSrc_, K_USHORT usLen_)` `[static]`

Copy one buffer in memory into another.

Parameters

<i>pvDst_</i>	Pointer to the destination buffer
<i>pvSrc_</i>	Pointer to the source buffer
<i>usLen_</i>	Number of bytes to copy from source to destination

Definition at line 273 of file [memutil.cpp](#).

13.46.2.6 `static void MemUtil::CopyString (char * szDst_, const char * szSrc_) [static]`

Copy a string from one buffer into another.

Parameters

<i>szDst_</i>	Pointer to the buffer to copy into
<i>szSrc_</i>	Pointer to the buffer to copy data from

Definition at line 290 of file [memutil.cpp](#).

13.46.2.7 `static void MemUtil::DecimalToHex (K_UCHAR ucData_, char * szText_) [static]`

Convert an 8-bit unsigned binary value as a hexadecimal string.

Parameters

<i>ucData_</i>	Value to convert into a string
<i>szText_</i>	Destination string buffer (3 bytes minimum)

Definition at line 28 of file [memutil.cpp](#).

13.46.2.8 `static void MemUtil::DecimalToString (K_UCHAR ucData_, char * szText_) [static]`

Convert an 8-bit unsigned binary value as a decimal string.

Parameters

<i>ucData_</i>	Value to convert into a string
<i>szText_</i>	Destination string buffer (4 bytes minimum)

Definition at line 122 of file [memutil.cpp](#).

13.46.2.9 `static void MemUtil::SetMemory (void * pvDst_, K_UCHAR ucVal_, K_USHORT usLen_) [static]`

Initialize a buffer of memory to a specified 8-bit pattern.

Parameters

<i>pvDst_</i>	Destination buffer to set
<i>ucVal_</i>	8-bit pattern to initialize each byte of destination with
<i>usLen_</i>	Length of the buffer (in bytes) to initialize

Definition at line 363 of file [memutil.cpp](#).

13.46.2.10 `static K_USHORT MemUtil::StringLength (const char * szStr_) [static]`

Compute the length of a string in bytes.

Parameters

<i>szStr_</i>	Pointer to the zero-terminated string to calculate the length of
---------------	------------------------------------------------------------------

Returns

length of the string (in bytes), not including the 0-terminator.

Definition at line 232 of file [memutil.cpp](#).

13.46.2.11 `static K_SHORT MemUtil::StringSearch (const char * szBuffer_, const char * szPattern_) [static]`

Search for the presence of one string as a substring within another.

Parameters

<i>szBuffer_</i>	Buffer to search for pattern within
<i>szPattern_</i>	Pattern to search for in the buffer

Returns

Index of the first instance of the pattern in the buffer, or -1 on no match.

Definition at line 307 of file [memutil.cpp](#).

13.46.2.12 `K_UCHAR MemUtil::Tokenize (const char * szBuffer_, Token_t * pastTokens_, K_UCHAR ucMaxTokens_) [static]`

Tokenize Function to tokenize a string based on a space delimiter.

This is a non-destructive function, which populates a [Token_t](#) descriptor array.

Parameters

<i>szBuffer_</i>	String to tokenize
<i>pastTokens_</i>	Pointer to the array of token descriptors
<i>ucMaxTokens_</i>	Maximum number of tokens to parse (i.e. size of <i>pastTokens_</i>)

Returns

Count of tokens parsed

Definition at line 376 of file [memutil.cpp](#).

The documentation for this class was generated from the following files:

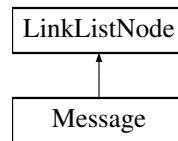

- [/home/moslevin/m3/embedded/stage/src/memutil.h](#)
- [/home/moslevin/m3/embedded/stage/src/memutil.cpp](#)

13.47 Message Class Reference

Class to provide message-based IPC services in the kernel.

```
#include <message.h>
```

Inheritance diagram for Message:

Public Member Functions

- void `Init` ()
Initialize the data and code in the message.
- void `SetData` (void *pvData_)
Set the data pointer for the message before transmission.
- void * `GetData` ()
Get the data pointer stored in the message upon receipt.
- void `SetCode` (K_USHORT usCode_)
Set the code in the message before transmission.
- K_USHORT `GetCode` ()
Return the code set in the message upon receipt.

Private Attributes

- void * `m_pvData`
Pointer to the message data.
- K_USHORT `m_usCode`
Message code, providing context for the message.

Additional Inherited Members

13.47.1 Detailed Description

Class to provide message-based IPC services in the kernel.

Definition at line 99 of file [message.h](#).

13.47.2 Member Function Documentation

13.47.2.1 K_USHORT Message::GetCode () [inline]

Return the code set in the message upon receipt.

Returns

User code set in the object

Definition at line 143 of file [message.h](#).

13.47.2.2 `void * Message::GetData () [inline]`

Get the data pointer stored in the message upon receipt.

Returns

Pointer to the data set in the message object

Definition at line 125 of file [message.h](#).

13.47.2.3 `Message::SetCode (K_USHORT usCode_) [inline]`

Set the code in the message before transmission.

Parameters

<code>usCode_</code>	Data code to set in the object
----------------------	--------------------------------

Definition at line 134 of file [message.h](#).

13.47.2.4 `void Message::SetData (void * pvData_) [inline]`

Set the data pointer for the message before transmission.

Parameters

<code>pvData_</code>	Pointer to the data object to send in the message
----------------------	---------------------------------------------------

Definition at line 116 of file [message.h](#).

The documentation for this class was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/message.h](#)

13.48 MessageQueue Class Reference

List of messages, used as the channel for sending and receiving messages between threads.

```
#include <message.h>
```

Public Member Functions

- `void Init ()`
Initialize the message queue prior to use.
- `Message * Receive ()`
Receive a message from the message queue.
- `Message * Receive (K_ULONG ulTimeWaitMS_)`
Receive a message from the message queue.
- `void Send (Message *pclSrc_)`
Send a message object into this message queue.
- `K_USHORT GetCount ()`
Return the number of messages pending in the "receive" queue.

Private Attributes

- [Semaphore m_clSemaphore](#)
Counting semaphore used to manage thread blocking.
- [DoubleLinkedList m_clLinkList](#)
List object used to store messages.

13.48.1 Detailed Description

List of messages, used as the channel for sending and receiving messages between threads.

Definition at line 201 of file [message.h](#).

13.48.2 Member Function Documentation

13.48.2.1 K_USHORT MessageQueue::GetCount ()

Return the number of messages pending in the "receive" queue.

Returns

Count of pending messages in the queue.

Definition at line 149 of file [message.cpp](#).

13.48.2.2 Message * MessageQueue::Receive ()

Receive a message from the message queue.

If the message queue is empty, the thread will block until a message is available.

Returns

Pointer to a message object at the head of the queue

Definition at line 91 of file [message.cpp](#).

13.48.2.3 Message * MessageQueue::Receive (K_ULONG uWaitTimeMS_)

Receive a message from the message queue.

If the message queue is empty, the thread will block until a message is available for the duration specified. If no message arrives within that duration, the call will return with NULL.

Parameters

<i>uWaitTimeMS_</i>	The amount of time in ms to wait for a message before timing out and unblocking the waiting thread.
---------------------	-----------------------------------------------------------------------------------------------------

Returns

Pointer to a message object at the head of the queue or NULL on timeout.

Definition at line 111 of file [message.cpp](#).

13.48.2.4 void MessageQueue::Send (Message * *pcSrc_*)

Send a message object into this message queue.

Will un-block the first waiting thread blocked on this queue if that occurs.

Parameters

<i>pcSrc_</i>	Pointer to the message object to add to the queue
---------------	---------------------------------------------------

Definition at line 133 of file [message.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/message.h](#)
- [/home/moslevin/m3/embedded/stage/src/message.cpp](#)

13.49 MouseEvent_t Struct Reference

Mouse UI event structure.

```
#include <gui.h>
```

Public Attributes

- K_USHORT [usX](#)
absolute X location of the mouse (pixel)
- K_USHORT [usY](#)
absolute Y location of the mouse (pixel)
- union {
 K_UCHAR [ucFlags](#)
 modifier flags for the event
 struct {
 unsigned int [bLeftState](#):1
 State of the left mouse button.
 unsigned int [bRightState](#):1
 State of the right mouse button.
 unsigned int [bMiddleState](#):1
 State of the middle mouse button.
 unsigned int [bScrollUp](#):1
 State of the scroll wheel (UP)
 unsigned int [bScrollDown](#):1
 State of the scroll wheel (DOWN)
 }
};

13.49.1 Detailed Description

Mouse UI event structure.

Definition at line 102 of file [gui.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/gui.h](#)

13.50 Mutex Class Reference

Mutual-exclusion locks, based on [BlockingObject](#).

```
#include <mutex.h>
```

Inheritance diagram for Mutex:

Public Member Functions

- void [Init](#) ()
Initialize a mutex object for use - must call this function before using the object.
- void [Claim](#) ()
Claim the mutex.
- bool [Claim](#) (K_ULONG ulWaitTimeMS_)
- void [WakeMe](#) ([Thread](#) *pclOwner_)
Wake a thread blocked on the mutex.
- void [SetExpired](#) (bool bExpired_)
SetExpired Set the expired state of the mutex.
- void [Release](#) ()
Release the mutex.

Private Member Functions

- K_UCHAR [WakeNext](#) ()
Wake the next thread waiting on the [Mutex](#).

Private Attributes

- K_UCHAR [m_ucRecurse](#)
The recursive lock-count when a mutex is claimed multiple times by the same owner.
- K_UCHAR [m_bReady](#)
State of the mutex - true = ready, false = claimed.
- K_UCHAR [m_ucMaxPri](#)
Maximum priority of thread in queue, used for priority inheritance.
- [Thread](#) * [m_pclOwner](#)
Pointer to the thread that owns the mutex (when claimed)
- bool [m_bExpired](#)
Whether or not a timed mutex has expired (true = expired)

Additional Inherited Members

13.50.1 Detailed Description

Mutual-exclusion locks, based on [BlockingObject](#).

Definition at line 68 of file [mutex.h](#).

13.50.2 Member Function Documentation

13.50.2.1 void Mutex::Claim ()

Claim the mutex.

When the mutex is claimed, no other thread can claim a region protected by the object.

Definition at line 97 of file [mutex.cpp](#).

13.50.2.2 bool Mutex::Claim (K_ULONG ulWaitTimeMS_)

Parameters

<i>ulWaitTimeMS_</i>	
----------------------	--

Returns

true - mutex was claimed within the time period specified
false - mutex operation timed-out before the claim operation.

Definition at line 101 of file [mutex.cpp](#).

13.50.2.3 void Mutex::Release ()

Release the mutex.

When the mutex is released, another object can enter the mutex-protected region.

Definition at line 209 of file [mutex.cpp](#).

13.50.2.4 void Mutex::SetExpired (bool bExpired_) [inline]

SetExpired Set the expired state of the mutex.

Used by the internal timer-related functions of the kernel - not for use by app code.

Parameters

<i>bExpired_</i>	true = expired, false = not expired
------------------	-------------------------------------

Definition at line 118 of file [mutex.h](#).

13.50.2.5 void Mutex::WakeMe (Thread * pOwner_)

Wake a thread blocked on the mutex.

This is an internal function used for implementing timed mutexes relying on timer callbacks. Since these do not have access to the private data of the mutex and its base classes, we have to wrap this as a public method - do not use this for any other purposes.

Parameters

<i>pOwner_</i>	Thread to unblock from this object.
----------------	-----------------------------------------------------

Definition at line 55 of file [mutex.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/mutex.h](#)

- [/home/moslevin/m3/embedded/stage/src/mutex.cpp](#)

13.51 NLFS Class Reference

Nice Little File System class.

```
#include <nlfs.h>
```

Inheritance diagram for NLFS:

Public Member Functions

- void [Format](#) ([NLFS_Host_t](#) *puHost_, K_ULONG ulTotalSize_, K_USHORT usNumFiles_, K_USHORT usDataBlockSize_)
Format/Create a new filesystem with the configuration specified in the parameters.
- void [Mount](#) ([NLFS_Host_t](#) *puHost_)
Re-mount a previously-created filesystem using this FS object.
- K_USHORT [Create_File](#) (const K_CHAR *szPath_)
Create_File creates a new file object at the specified path.
- K_USHORT [Create_Dir](#) (const K_CHAR *szPath_)
Create_Dir creates a new directory at the specified path.
- K_USHORT [Delete_File](#) (const K_CHAR *szPath_)
Delete_File Removes a file from disk.
- K_USHORT [Delete_Folder](#) (const K_CHAR *szPath_)
Delete_Folder Remove a folder from disk.
- void [Cleanup_Node_Links](#) (K_USHORT usNode_, [NLFS_Node_t](#) *pstNode_)
Cleanup_Node_Links Remove the links between the given node and its parent/peer nodes.
- K_USHORT [Find_Parent_Dir](#) (const K_CHAR *szPath_)
Find_Parent_Dir returns the directory under which the specified file object lives.
- K_USHORT [Find_File](#) (const K_CHAR *szPath_)
Find_File returns the file node ID of the object at a given path.
- void [Print](#) (void)
Print displays a summary of files in the filesystem.
- K_ULONG [GetBlockSize](#) (void)
GetBlockSize retrieves the data block size for the filesystem.
- K_ULONG [GetNumBlocks](#) (void)
GetNumBlocks retrieves the number of data blocks in the filesystem.
- K_ULONG [GetNumBlocksFree](#) (void)
GetNumBlocksFree retrieves the number of free data blocks in the filesystem.
- K_ULONG [GetNumFiles](#) (void)
GetNumFiles retrieves the maximum number of files in the filesystem.
- K_USHORT [GetNumFilesFree](#) (void)
GetNumFilesFree retrieves the number of free blocks in the filesystem.
- K_USHORT [GetFirstChild](#) (K_USHORT usNode_)
GetFirstChild Return the first child node for a node representing a directory.

- K_USHORT [GetNextPeer](#) (K_USHORT usNode_)
GetNextPeer Return the Node ID of a File/Directory's next peer.
- K_BOOL [GetStat](#) (K_USHORT usNode_, [NLFS_File_Stat_t](#) *pstStat_)
GetStat Get the status of a file on-disk.

Protected Member Functions

- K_CHAR [Find_Last_Slash](#) (const K_CHAR *szPath_)
Find_Last_Slash Finds the location of the last '/' character in a path.
- K_BOOL [File_Names_Match](#) (const K_CHAR *szPath_, [NLFS_Node_t](#) *pstNode_)
File_Names_Match Determines if a given path matches the name in a file node.
- virtual void [Read_Node](#) (K_USHORT usNode_, [NLFS_Node_t](#) *pstNode_)=0
Read_Node is an implementation-specific method used to read a file node from physical storage into a local data struture.
- virtual void [Write_Node](#) (K_USHORT usNode_, [NLFS_Node_t](#) *pstNode_)=0
Write_Node is an implementation-specific method used to write a file node from a local structure back to the physical storage.
- virtual void [Read_Block_Header](#) (K_ULONG ulBlock_, [NLFS_Block_t](#) *pstBlock_)=0
Read_Block_Header is an implementation-specific method used to read a file block header from physical storage into a local struct.
- virtual void [Write_Block_Header](#) (K_ULONG ulBlock_, [NLFS_Block_t](#) *pstFileBlock_)=0
Write_Block_Header is an implementation-specific method used to write a file block header back to physical storage from a local struct.
- virtual void [Read_Block](#) (K_ULONG ulBlock_, K_ULONG ulOffset_, void *pvData_, K_ULONG ulLen_)=0
Read_Block is an implementation-specific method used to read raw file data from physical storage into a local buffer.
- virtual void [Write_Block](#) (K_ULONG ulBlock_, K_ULONG ulOffset_, void *pvData_, K_ULONG ulLen_)=0
Write_Block is an implementation-specific method used to write a piece of file data to its data block in the underlying physical storage.
- void [RootSync](#) ()
RootSync Synchronize the filesystem config in the object back to the underlying storage mechanism.
- void [Repair](#) ()
Repair Checks a filesystem for inconsistencies and makes repairs in order to avoid losing storage blocks.
- void [Print_Free_Details](#) (K_USHORT usNode_)
Print_Free_Details Print details about a free node.
- void [Print_File_Details](#) (K_USHORT usNode_)
Print_File_Details displays information about a given file node.
- void [Print_Dir_Details](#) (K_USHORT usNode_)
Print_Dir_Details displays information about a given directory node.
- void [Print_Node_Details](#) (K_USHORT usNode_)
Print_Node_Details prints details about a node, the details differ based on whether it's a file/directory/root node.
- void [Push_Free_Node](#) (K_USHORT usNode_)
Push_Free_Node returns a file node back to the free node list.
- K_USHORT [Pop_Free_Node](#) (void)
Pop_Free_Node returns the first free file node in the free list.
- void [Push_Free_Block](#) (K_ULONG ulBlock_)
Push_Free_Block returns a file block back to the head of the free block list.
- K_ULONG [Pop_Free_Block](#) (void)
Pop_Free_Block pops a file data block from the head of the free list.
- K_ULONG [Append_Block_To_Node](#) ([NLFS_Node_t](#) *pstFile_)
Append_Block_To_Node adds a file data block to the end of a file.
- K_USHORT [Create_File_i](#) (const K_CHAR *szPath_, [NLFS_Type_t](#) eType_)
Create_File_i is the private method used to create a file or directory.
- void [Set_Node_Name](#) ([NLFS_Node_t](#) *pstFileNode_, const K_CHAR *szPath_)
Set_Node_Name sets the name of a file or directory node.

Protected Attributes

- [NLFS_Host_t * m_puHost](#)
Local, cached copy of host FS pointer.
- [NLFS_Root_Node_t m_stLocalRoot](#)
Local, cached copy of root.

Friends

- class **NLFS_File**

13.51.1 Detailed Description

Nice Little File System class.

Definition at line 280 of file [nlfs.h](#).

13.51.2 Member Function Documentation

13.51.2.1 K_ULONG NLFS::Append_Block_To_Node (NLFS_Node_t * *pstFile_*) [protected]

Append_Block_To_Node adds a file data block to the end of a file.

Parameters

<i>in</i>	<i>pstFile_</i>	- Pointer to the file node to add a block to
-----------	-----------------	----------------------------------------------

Returns

Data block ID of the allocated block, or INVALID_BLOCK on failure.

Definition at line 245 of file [nlfs.cpp](#).

13.51.2.2 void NLFS::Cleanup_Node_Links (K_USHORT *usNode_*, NLFS_Node_t * *pstNode_*)

Cleanup_Node_Links Remove the links between the given node and its parent/peer nodes.

Parameters

<i>usNode_</i>	Index of the node
<i>pstNode_</i>	Pointer to a local copy of the node data

Definition at line 598 of file [nlfs.cpp](#).

13.51.2.3 K_USHORT NLFS::Create_Dir (const K_CHAR * *szPath_*)

Create_Dir creates a new directory at the specified path.

Parameters

<i>in</i>	<i>szPath_</i>	- Path to the directory to create
-----------	----------------	-----------------------------------

Returns

ID of the created dir, or INVALID_NODE if the path cannot be resolved, or the file already exists.

Definition at line 586 of file [nlfs.cpp](#).

13.51.2.4 K_USHORT NLFS::Create_File (const K_CHAR * *szPath_*)

Create_File creates a new file object at the specified path.

Parameters

<i>in</i>	<i>szPath_</i>	- Path to the file to create
-----------	----------------	------------------------------

Returns

ID of the created file, or INVALID_NODE if the path cannot be resolved, or the file already exists.

Definition at line 573 of file [nlfs.cpp](#).

13.51.2.5 K_USHORT NLFS::Create_File_i (const K_CHAR * *szPath_*, NLFS_Type_t *eType_*) [protected]

Create_File_i is the private method used to create a file or directory.

Parameters

<i>in</i>	<i>szPath_</i>	- Path of the file or directory to create
<i>in</i>	<i>eType_</i>	- Type of file to create

Returns

File node ID of the newly created file, or INVALID_NODE on failure.

! ToDo - set real user/group IDs

Definition at line 490 of file [nlfs.cpp](#).

13.51.2.6 K_USHORT NLFS::Delete_File (const K_CHAR * *szPath_*)

Delete_File Removes a file from disk.

Parameters

<i>szPath_</i>	Path of the file to remove
----------------	----------------------------

Returns

Index of the node deleted or INVALID_NODE on error

Definition at line 705 of file [nlfs.cpp](#).

13.51.2.7 K_USHORT NLFS::Delete_Folder (const K_CHAR * *szPath_*)

Delete_Folder Remove a folder from disk.

Parameters

<i>szPath_</i>	Path of the folder to remove
----------------	------------------------------

Returns

Index of the node deleted or INVALID_NODE on error

Definition at line 662 of file [nlfs.cpp](#).

13.51.2.8 K_BOOL NLFS::File_Names_Match (const K_CHAR * *szPath_*, NLFS_Node_t * *pstNode_*) [protected]

File_Names_Match Determines if a given path matches the name in a file node.

Parameters

in	<i>szPath_</i>	- file path to search for
in	<i>pstNode_</i>	- pointer to a fs node

Returns

true if the filename in the path matches the filename in the node.

Definition at line 42 of file [nlfs.cpp](#).

13.51.2.9 K_USHORT NLFS::Find_File (const K_CHAR * *szPath_*)

Find_File returns the file node ID of the object at a given path.

Parameters

in	<i>szPath_</i>	- Path of the file to search for
----	----------------	----------------------------------

Returns

file node ID, or INVALID_NODE if the path is invalid.

Definition at line 405 of file [nlfs.cpp](#).

13.51.2.10 K_CHAR NLFS::Find_Last_Slash (const K_CHAR * *szPath_*) [protected]

Find_Last_Slash Finds the location of the last '/' character in a path.

Parameters

in	<i>szPath_</i>	- String representing a '/' delimited path.
----	----------------	---------------------------------------------

Returns

the byte offset of the last slash char in the path.

Definition at line 26 of file [nlfs.cpp](#).

13.51.2.11 K_USHORT NLFS::Find_Parent_Dir (const K_CHAR * *szPath_*)

Find_Parent_Dir returns the directory under which the specified file object lives.

Parameters

in	<i>szPath_</i>	- Path of the file to find parent directory node for
----	----------------	------------------------------------------------------

Returns

directory node ID, or INVALID_NODE if the path is invalid.

Definition at line 289 of file [nlfs.cpp](#).

13.51.2.12 void NLFS::Format (NLFS_Host_t * *puHost_*, K_ULONG *ulTotalSize_*, K_USHORT *usNumFiles_*, K_USHORT *usDataBlockSize_*)

Format/Create a new filesystem with the configuration specified in the parameters.

Parameters

in	<i>puHost_</i>	- Pointer to the FS storage object, interpreted by the physical medium driver.
in	<i>ulTotalSize_</i>	- Total size of the object to format (in bytes)
in	<i>usNumFiles_</i>	- Number of file nodes to create in the FS. This parameter determines the maximum number of files and directories that can exist simultaneously in the filesystem. All filesystem storage not allocated towards file nodes is automatically used as data-blocks.
	<i>usDataBlockSize_</i>	- Size of each data block (in bytes). Setting a lower block size is a good way to avoid wasting space in small-files due to over-allocation of storage (size on-disk vs. actual file size). However, each block requires a metadata object, which can also add to overhead. Also, file read/write speed can vary significantly based on the block size - in many scenarios, larger blocks can lead to higher throughput.

Definition at line 756 of file [nlfs.cpp](#).

13.51.2.13 K_ULONG NLFS::GetBlockSize (void) [inline]

GetBlockSize retrieves the data block size for the filesystem.

Returns

The size of a data block in the filesystem, as configured at format.

Definition at line 382 of file [nlfs.h](#).

13.51.2.14 K_USHORT NLFS::GetFirstChild (K_USHORT *usNode_*)

GetFirstChild Return the first child node for a node representing a directory.

Parameters

<i>usNode_</i>	Index of a directory node
----------------	---------------------------

Returns

Node ID of the first child node or INVALID_NODE on failure

Definition at line 890 of file [nlfs.cpp](#).

13.51.2.15 K_USHORT NLFS::GetNextPeer (K_USHORT *usNode_*)

GetNextPeer Return the Node ID of a File/Directory's next peer.

Parameters

<i>usNode_</i>	Node index of the current object
----------------	----------------------------------

Returns

Node ID of the next peer object

Definition at line 908 of file [nlfs.cpp](#).

13.51.2.16 K_ULONG NLFS::GetNumBlocks (void) [inline]

GetNumBlocks retrieves the number of data blocks in the filesystem.

Returns

The total number of blocks in the filesystem

Definition at line 388 of file [nlfs.h](#).

13.51.2.17 K_ULONG NLFS::GetNumBlocksFree (void) [inline]

GetNumBlocksFree retrieves the number of free data blocks in the filesystem.

Returns

The number of available blocks in the filesystem

Definition at line 395 of file [nlfs.h](#).

13.51.2.18 K_ULONG NLFS::GetNumFiles (void) [inline]

GetNumFiles retrieves the maximum number of files in the filesystem.

Returns

The maximum number of files that can be allocated in the system

Definition at line 401 of file [nlfs.h](#).

13.51.2.19 K_USHORT NLFS::GetNumFilesFree (void) [inline]

GetNumFilesFree retrieves the number of free blocks in the filesystem.

Returns

The number of free file nodes in the filesystem

Definition at line 407 of file [nlfs.h](#).

13.51.2.20 `K_BOOL NLFS::GetStat (K_USHORT usNode_, NLFS_File_Stat_t * pstStat_)`

GetStat Get the status of a file on-disk.

Parameters

<i>usNode_</i>	Node representing the file
<i>pstStat_</i>	Pointer to the object containing the status

Returns

true on success, false on failure

Definition at line 920 of file [nlfs.cpp](#).

13.51.2.21 `void NLFS::Mount (NLFS_Host_t * puHost_)`

Re-mount a previously-created filesystem using this FS object.

Parameters

<i>in</i>	<i>puHost_</i>	- Pointer to the filesystem object
-----------	----------------	------------------------------------

! Must set the host pointer first.

Definition at line 859 of file [nlfs.cpp](#).

13.51.2.22 `K_ULONG NLFS::Pop_Free_Block (void)` [protected]

Pop_Free_Block pops a file data block from the head of the free list.

Returns

the block index of the file node popped from the head of the free block list

Definition at line 192 of file [nlfs.cpp](#).

13.51.2.23 `K_USHORT NLFS::Pop_Free_Node (void)` [protected]

Pop_Free_Node returns the first free file node in the free list.

Returns

the index of the file node popped off the free list

Definition at line 145 of file [nlfs.cpp](#).

13.51.2.24 `void NLFS::Print_Dir_Details (K_USHORT usNode_)` [protected]

Print_Dir_Details displays information about a given directory node.

Parameters

<i>in</i>	<i>usNode_</i>	- directory index to display details for
-----------	----------------	------------------------------------------

Definition at line 90 of file [nlfs.cpp](#).

13.51.2.25 void NLFS::Print_File_Details (K_USHORT *usNode_*) [protected]

Print_File_Details displays information about a given file node.

Parameters

in	<i>usNode_</i>	- file index to display details for
----	----------------	-------------------------------------

Definition at line 68 of file [nlfs.cpp](#).

13.51.2.26 void NLFS::Print_Free_Details (K_USHORT *usNode_*) [protected]

Print_Free_Details Print details about a free node.

Parameters

<i>usNode_</i>	Node to print details for
----------------	---------------------------

Definition at line 106 of file [nlfs.cpp](#).

13.51.2.27 void NLFS::Print_Node_Details (K_USHORT *usNode_*) [protected]

Print_Node_Details prints details about a node, the details differ based on whether it's a file/directory/root node.

Parameters

in	<i>usNode_</i>	- node to show details for
----	----------------	----------------------------

Definition at line 115 of file [nlfs.cpp](#).

13.51.2.28 void NLFS::Push_Free_Block (K_ULONG *ulBlock_*) [protected]

Push_Free_Block returns a file block back to the head of the free block list.

Parameters

in	<i>ulBlock_</i>	- index of the data block to free
----	-----------------	-----------------------------------

Definition at line 224 of file [nlfs.cpp](#).

13.51.2.29 void NLFS::Push_Free_Node (K_USHORT *usNode_*) [protected]

Push_Free_Node returns a file node back to the free node list.

Parameters

in	<i>usNode_</i>	- index of the file node to push back to the free list.
----	----------------	---------------------------------------------------------

Definition at line 172 of file [nlfs.cpp](#).

13.51.2.30 virtual void NLFS::Read_Block (K_ULONG *ulBlock_*, K_ULONG *ulOffset_*, void * *pvData_*, K_ULONG *ulLen_*)
[protected], [pure virtual]

Read_Block is an implementation-specific method used to read raw file data from physical storage into a local buffer.

Parameters

in	<i>ulBlock_</i>	- filesystem block ID corresponding to the file
in	<i>ulOffset_</i>	- offset (in bytes) from the beginning of the block
out	<i>pvData_</i>	- output buffer to read into
in	<i>ulLen_</i>	- length of data to read (in bytes)

Implemented in [NLFS_RAM](#).

13.51.2.31 `virtual void NLFS::Read_Block_Header (K_ULONG ulBlock_, NLFS_Block_t * pstBlock_)` [protected],
[pure virtual]

`Read_Block_Header` is an implementation-specific method used to read a file block header from physical storage into a local struct.

Parameters

in	<i>ulBlock_</i>	- data block index
out	<i>pstBlock_</i>	- block header structure to read into

Implemented in [NLFS_RAM](#).

13.51.2.32 `virtual void NLFS::Read_Node (K_USHORT usNode_, NLFS_Node_t * pstNode_)` [protected], [pure virtual]

`Read_Node` is an implementation-specific method used to read a file node from physical storage into a local data structure.

Parameters

in	<i>usNode_</i>	- File node index
out	<i>pstNode_</i>	- Pointer to the file node object to read into

Implemented in [NLFS_RAM](#).

13.51.2.33 `void NLFS::RootSync ()` [protected]

`RootSync` Synchronize the filesystem config in the object back to the underlying storage mechanism.

This needs to be called to ensure that underlying storage is kept consistent when creating or deleting files.

Definition at line 879 of file [nlfs.cpp](#).

13.51.2.34 `void NLFS::Set_Node_Name (NLFS_Node_t * pstFileNode_, const K_CHAR * szPath_)` [protected]

`Set_Node_Name` sets the name of a file or directory node.

Parameters

in	<i>pstFileNode_</i>	- Pointer to a file node structure to name
in	<i>szPath_</i>	- Name for the file

Definition at line 458 of file [nlfs.cpp](#).

13.51.2.35 `virtual void NLFS::Write_Block (K_ULONG ulBlock_, K_ULONG ulOffset_, void * pvData_, K_ULONG ulLen_)`
`[protected],[pure virtual]`

Write_Block is an implementation-specific method used to write a piece of file data to its data block in the underlying physical storage.

Parameters

in	<i>ulBlock_</i>	- filesystem block ID corresponding to the file
in	<i>ulOffset_</i>	- offset (in bytes) from the beginning of the block
in	<i>pvData_</i>	- data buffer to write to disk
in	<i>ulLen_</i>	- length of data to write (in bytes)

Implemented in [NLFS_RAM](#).

13.51.2.36 `virtual void NLFS::Write_Block_Header (K_ULONG ulBlock_, NLFS_Block_t * pstFileBlock_)`
`[protected],[pure virtual]`

Write_Block_Header is an implementation-specific method used to write a file block header back to physical storage from a local struct.

Parameters

in	<i>ulBlock_</i>	- data block index
in	<i>pstFileBlock_</i>	- pointer to the local data structure to write from

Implemented in [NLFS_RAM](#).

13.51.2.37 `virtual void NLFS::Write_Node (K_USHORT usNode_, NLFS_Node_t * pstNode_)` `[protected],[pure virtual]`

Write_Node is an implementation-specific method used to write a file node from a local structure back to the physical storage.

Parameters

in	<i>usNode_</i>	- File node index
in	<i>pstNode_</i>	- Pointer to the file node object to write from

Implemented in [NLFS_RAM](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/nlfs.h](#)
- [/home/moslevin/m3/embedded/stage/src/nlfs.cpp](#)

13.52 NLFS_Block_t Struct Reference

Block data structure.

```
#include <nlfs.h>
```

Public Attributes

- K_ULONG [ulNextBlock](#)

```

    Index of the next block.
    • union {
        K_UCHAR ucFlags
        Block Flags.
        struct {
            unsigned int uAllocated
            1 if allocated
            unsigned int uCheckBit
            Used for continuity checks.
        }
    };

```

13.52.1 Detailed Description

Block data structure.

Contains the block index of the next data block (either in the file, or in the free-data pool), as well as any special flags.

Definition at line 232 of file [nlfs.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/nlfs.h](#)

13.53 NLFS_File Class Reference

The [NLFS_File](#) class.

```
#include <nlfs_file.h>
```

Public Member Functions

- int [Open](#) (NLFS *pclFS_, const K_CHAR *szPath_, NLFS_File_Mode_t eMode_)
Open Opens a file from a given filesystem.
- int [Read](#) (void *pvBuf_, K_ULONG ulLen_)
Read Read bytes from a file into a specified data buffer.
- int [Write](#) (void *pvBuf_, K_ULONG ulLen_)
Write Write a specified blob of data to the file.
- int [Seek](#) (K_ULONG ulOffset_)
Seek Seek to the specified byte offset within the file.
- int [Close](#) (void)
Close Is used to close an open file buffer.

Private Attributes

- NLFS * [m_pclFileSystem](#)
Pointer to the host filesystem.
- K_ULONG [m_ulOffset](#)
Current byte offset within the file.
- K_ULONG [m_ulCurrentBlock](#)
Index of the current filesystem block.
- K_USHORT [m_usFile](#)

File index of the current file.

- [NLFS_File_Mode_t m_ucFlags](#)

File mode flags.

- [NLFS_Node_t m_stNode](#)

Local copy of the file node.

13.53.1 Detailed Description

The [NLFS_File](#) class.

This class contains an implementation of file-level access built on-top of the [NLFS](#) filesystem architecture. An instance of this class represents an active/open file from inside the NLFSfilesystem.

Definition at line 45 of file [nlfs_file.h](#).

13.53.2 Member Function Documentation

13.53.2.1 int NLFS_File::Close (void)

Close Is used to close an open file buffer.

Returns

0 on success, -1 on failure.

Definition at line 272 of file [nlfs_file.cpp](#).

13.53.2.2 int NLFS_File::Open (NLFS * *pcIFS_*, const K.CHAR * *szPath_*, NLFS_File_Mode_t *eMode_*)

Open Opens a file from a given filesystem.

Parameters

<i>pcIFS_</i>	- Pointer to the NLFS filesystem containing the file
<i>szPath_</i>	- Path to the file within the NLFS filesystem
<i>eMode_</i>	- File open mode

Returns

0 on success, -1 on failure

Definition at line 26 of file [nlfs_file.cpp](#).

13.53.2.3 int NLFS_File::Read (void * *pvBuf_*, K.ULONG *ulLen_*)

Read Read bytes from a file into a specified data buffer.

Parameters

in	<i>ulLen_</i>	- Length (in bytes) of data to read
out	<i>pvBuf_</i>	- Pointer to the buffer to read into

Returns

Number of bytes read from the file

Definition at line 151 of file [nlfs_file.cpp](#).

13.53.2.4 int NLFS_File::Seek (K_ULONG ulOffset_)

Seek Seek to the specified byte offset within the file.

Parameters

<i>in</i>	<i>ulOffset_</i>	Offset in bytes from the beginning of the file
-----------	------------------	------------------------------------------------

Returns

0 on success, -1 on failure

Definition at line 112 of file [nlfs_file.cpp](#).

13.53.2.5 int NLFS_File::Write (void * pvBuf_, K_ULONG ulLen_)

Write Write a specified blob of data to the file.

Parameters

<i>in</i>	<i>ulLen_</i>	- Length (in bytes) of the source buffer
<i>in</i>	<i>pvBuf_</i>	- Pointer to the data buffer containing the data to be written

Returns

Number of bytes written to the file

Definition at line 217 of file [nlfs_file.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/nlfs_file.h](#)
- [/home/moslevin/m3/embedded/stage/src/nlfs_file.cpp](#)

13.54 NLFS_File_Node_t Struct Reference

Data structure for the "file" FS-node type.

```
#include <nlfs.h>
```

Public Attributes

- K_CHAR [acFileName](#) [16]
Arbitrary, 16-char filename.
- K_USHORT [usNextPeer](#)
Index of the next peer file node.
- K_USHORT [usPrevPeer](#)
Index of the previous peer node.

- K_UCHAR [ucGroup](#)
Group ID of the owner.
- K_UCHAR [ucUser](#)
User ID of the owner.
- K_USHORT [usPerms](#)
File permissions (POSIX-style)
- K_USHORT [usParent](#)
Index of the parent file node.
- K_USHORT [usChild](#)
Index of the first child node.
- K_ULONG [ulAllocSize](#)
Size of the file (allocated)
- K_ULONG [ulFileSize](#)
Size of the file (in-bytes)
- K_ULONG [ulFirstBlock](#)
Index of the first file block.
- K_ULONG [ulLastBlock](#)
Index of the last file block.

13.54.1 Detailed Description

Data structure for the "file" FS-node type.

Note that this is the same as for a directory node (although fewer fields are used for that case, as documented).

Definition at line 168 of file [nlfs.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/nlfs.h](#)

13.55 NLFS_File_Stat_t Struct Reference

Structure used to report the status of a given file.

```
#include <nlfs.h>
```

Public Attributes

- K_ULONG [ulAllocSize](#)
Size of the file including partial blocks.
- K_ULONG [ulFileSize](#)
Actual size of the file.
- K_USHORT [usPerms](#)
Permissions attached to the file.
- K_UCHAR [ucUser](#)
User associated with this file.
- K_UCHAR [ucGroup](#)
Group associated with this file.
- K_CHAR [acFileName](#) [16]
Copy of the file name.

13.55.1 Detailed Description

Structure used to report the status of a given file.

Definition at line 266 of file [nlfs.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/nlfs.h](#)

13.56 NLFS_Host_t Union Reference

Union used for managing host-specific pointers/data-types.

```
#include <nlfs.h>
```

Public Attributes

- void * **pvData**
- uint32_t **u32Data**
- uint64_t **u64Data**
- K_ADDR **kaData**

13.56.1 Detailed Description

Union used for managing host-specific pointers/data-types.

This is all pretty abstract, as the data represented here is only accessed by the underlying physical media drive.

Definition at line 253 of file [nlfs.h](#).

The documentation for this union was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/nlfs.h](#)

13.57 NLFS_Node_t Struct Reference

Filesystem node data structure.

```
#include <nlfs.h>
```

Public Attributes

- [NLFS_Type_t](#) **eBlockType**
Block type ID.
- union {
 [NLFS_Root_Node_t](#) **stRootNode**
 Root Filesystem Node.
 [NLFS_File_Node_t](#) **stFileNode**
 File/Directory Node.
};

13.57.1 Detailed Description

Filesystem node data structure.

Contains the block type, as well as the union between the various FS-node data structures. This is also the same data format as how data is stored "on-disk"

Definition at line 215 of file [nlfs.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/nlfs.h](#)

13.58 NLFS_RAM Class Reference

The [NLFS_RAM](#) class.

```
#include <nlfs_ram.h>
```

Inheritance diagram for NLFS_RAM:

Private Member Functions

- virtual void [Read_Node](#) (K_USHORT usNode_, [NLFS_Node_t](#) *pstNode_)
Read_Node is an implementation-specific method used to read a file node from physical storage into a local data struture.
- virtual void [Write_Node](#) (K_USHORT usNode_, [NLFS_Node_t](#) *pstNode_)
Write_Node is an implementation-specific method used to write a file node from a local structure back to the physical storage.
- virtual void [Read_Block_Header](#) (K_ULONG ulBlock_, [NLFS_Block_t](#) *pstBlock_)
Read_Block_Header is an implementation-specific method used to read a file block header from physical storage into a local struct.
- virtual void [Write_Block_Header](#) (K_ULONG ulBlock_, [NLFS_Block_t](#) *pstFileBlock_)
Write_Block_Header is an implementation-specific method used to write a file block header back to physical storage from a local struct.
- virtual void [Read_Block](#) (K_ULONG ulBlock_, K_ULONG ulOffset_, void *pvData_, K_ULONG ulLen_)
Read_Block is an implementation-specific method used to read raw file data from physical storage into a local buffer.
- void [Write_Block](#) (K_ULONG ulBlock_, K_ULONG ulOffset_, void *pvData_, K_ULONG ulLen_)
Write_Block is an implementation-specific method used to write a piece of file data to its data block in the underlying physical storage.

Additional Inherited Members

13.58.1 Detailed Description

The [NLFS_RAM](#) class.

This class implements an [NLFS](#) filesystem in a RAM buffer. In this case, the host pointer passed into the "format" call is a pointer to the locally- allocated buffer in which the filesystem lives.

Definition at line 31 of file [nlfs_ram.h](#).

13.58.2 Member Function Documentation

13.58.2.1 `void NLFS_RAM::Read_Block (K_ULONG ulBlock_, K_ULONG ulOffset_, void * pvData_, K_ULONG ulLen_)`
[private], [virtual]

Read_Block is an implementation-specific method used to read raw file data from physical storage into a local buffer.

Parameters

in	<i>ulBlock_</i>	- filesystem block ID corresponding to the file
in	<i>ulOffset_</i>	- offset (in bytes) from the beginning of the block
out	<i>pvData_</i>	- output buffer to read into
in	<i>ulLen_</i>	- length of data to read (in bytes)

Implements [NLFS](#).

Definition at line 63 of file [nlfs_ram.cpp](#).

13.58.2.2 `void NLFS_RAM::Read_Block_Header (K_ULONG ulBlock_, NLFS_Block_t * pstBlock_)` [private], [virtual]

Read_Block_Header is an implementation-specific method used to read a file block header from physical storage into a local struct.

Parameters

in	<i>ulBlock_</i>	- data block index
out	<i>pstBlock_</i>	- block header structure to read into

Implements [NLFS](#).

Definition at line 43 of file [nlfs_ram.cpp](#).

13.58.2.3 `void NLFS_RAM::Read_Node (K_USHORT usNode_, NLFS_Node_t * pstNode_)` [private], [virtual]

Read_Node is an implementation-specific method used to read a file node from physical storage into a local data structure.

Parameters

in	<i>usNode_</i>	- File node index
out	<i>pstNode_</i>	- Pointer to the file node object to read into

Implements [NLFS](#).

Definition at line 25 of file [nlfs_ram.cpp](#).

13.58.2.4 `void NLFS_RAM::Write_Block (K_ULONG ulBlock_, K_ULONG ulOffset_, void * pvData_, K_ULONG ulLen_)`
[private], [virtual]

Write_Block is an implementation-specific method used to write a piece of file data to its data block in the underlying physical storage.

Parameters

in	<i>ulBlock_</i>	- filesystem block ID corresponding to the file
in	<i>ulOffset_</i>	- offset (in bytes) from the beginning of the block
in	<i>pvData_</i>	- data buffer to write to disk
in	<i>ulLen_</i>	- length of data to write (in bytes)

Implements [NLFS](#).

Definition at line 73 of file [nlfs_ram.cpp](#).

13.58.2.5 void NLFS_RAM::Write_Block_Header (K_ULONG ulBlock_, NLFS_Block_t * pstFileBlock_) [private],
[virtual]

Write_Block_Header is an implementation-specific method used to write a file block header back to physical storage from a local struct.

Parameters

in	ulBlock_	- data block index
in	pstFileBlock_	- pointer to the local data structure to write from

Implements [NLFS](#).

Definition at line 53 of file [nlfs_ram.cpp](#).

13.58.2.6 void NLFS_RAM::Write_Node (K_USHORT usNode_, NLFS_Node_t * pstNode_) [private],[virtual]

Write_Node is an implementation-specific method used to write a file node from a local structure back to the physical storage.

Parameters

in	usNode_	- File node index
in	pstNode_	- Pointer to the file node object to write from

Implements [NLFS](#).

Definition at line 34 of file [nlfs_ram.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/nlfs_ram.h](#)
- [/home/moslevin/m3/embedded/stage/src/nlfs_ram.cpp](#)

13.59 NLFS_Root_Node_t Struct Reference

Data structure for the Root-configuration FS-node type.

```
#include <nlfs.h>
```

Public Attributes

- K_USHORT [usNumFiles](#)
Number of file nodes in the FS.
- K_USHORT [usNumFilesFree](#)
Number of free file nodes.
- K_USHORT [usNextFreeNode](#)
Index of the next free file.
- K_ULONG [ulNumBlocks](#)
Number of blocks in the FS.
- K_ULONG [ulNumBlocksFree](#)
Number of free blocks.

- K_ULONG [ulNextFreeBlock](#)
Index of the next free block.
- K_ULONG [ulBlockSize](#)
Size of each block on disk.
- K_ULONG [ulBlockOffset](#)
Byte-offset to the first block struct.
- K_ULONG [ulDataOffset](#)
Byte-offset to the first data block.

13.59.1 Detailed Description

Data structure for the Root-configuration FS-node type.

Definition at line 194 of file [nlfs.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/nlfs.h](#)

13.60 NotificationControl Class Reference

Inheritance diagram for NotificationControl:

Public Member Functions

- virtual void [Init](#) ()
Initialize the control - must be called before use.
- virtual void [Draw](#) ()
Redraw the control "cleanly".
- virtual [GuiReturn_t](#) [ProcessEvent](#) ([GuiEvent_t](#) *pstEvent_)
Process an event sent to the control.
- virtual void [Activate](#) (bool bActivate_)
Activate or deactivate the current control - used when switching from one active control to another.
- void [SetFont](#) ([Font_t](#) *pstFont_)
- void [SetCaption](#) (const K_CHAR *szCaption_)
- void [Trigger](#) (K_USHORT usTimeout_)

Private Attributes

- const K_CHAR * [m_szCaption](#)
- [Font_t](#) * [m_pstFont](#)
- K_USHORT [m_usTimeout](#)
- bool [m_bTrigger](#)
- bool [m_bVisible](#)

Additional Inherited Members

13.60.1 Detailed Description

Definition at line 29 of file [control_notification.h](#).

13.60.2 Member Function Documentation

13.60.2.1 `virtual void NotificationControl::Activate (bool bActivate_) [inline], [virtual]`

Activate or deactivate the current control - used when switching from one active control to another.

Parameters

<i>bActivate_</i>	- true to activate, false to deactivate
-------------------	-----------------------------------------

Implements [GuiControl](#).

Definition at line 43 of file [control_notification.h](#).

13.60.2.2 `void NotificationControl::Draw () [virtual]`

Redraw the control "cleanly".

Subclass specific.

Implements [GuiControl](#).

Definition at line 26 of file [control_notification.cpp](#).

13.60.2.3 `virtual void NotificationControl::Init () [inline], [virtual]`

Initialiize the control - must be called before use.

Implementation is subclass specific.

Implements [GuiControl](#).

Definition at line 32 of file [control_notification.h](#).

13.60.2.4 `GuiReturn_t NotificationControl::ProcessEvent (GuiEvent_t * pstEvent_) [virtual]`

Process an event sent to the control.

Subclass specific implementation.

Parameters

<i>pstEvent_</i>	Pointer to a struct containing the event data
------------------	-----------------------------------------------

Implements [GuiControl](#).

Definition at line 92 of file [control_notification.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/control_notification.h](#)
- [/home/moslevin/m3/embedded/stage/src/control_notification.cpp](#)

13.61 Option_t Struct Reference

Structure used to represent a command-line option with its arguments.

```
#include <shell_support.h>
```

Public Attributes

- [Token_t](#) * [pstStart](#)
Pointer to the beginning of a token array contain the option and its arguments.
- [K_UCHAR](#) [ucCount](#)
Number of tokens in the token array.

13.61.1 Detailed Description

Structure used to represent a command-line option with its arguments.

An option is defined as any token beginning with a "-" value. The tokens arguments are subsequent tokens that do not begin with "-".

Where no "-" values are specified, each token becomes its own option.

i.e. given the following command-line

```
mycmd -opt1 a b c -opt2 d e f -opt 3
```

The possible [Option_t](#) structures would be:

```
pstStart => Array containing tokens for -opt1, a, b, c
ucCount  => 4 (4 tokens, including the option token, "-opt1")

pstStart => Array containing tokens for -opt2, d, e, f
ucCount  => 4 (4 tokens, including the option token, "-opt2")

pstStart => Array containing tokens for -opt, 3
ucCount  => 2 (2 tokens, including the option token, "-opt3")
```

in the case of:

```
mycmd a b c
```

Possible token values would be:

```
pstStart => Array containing tokens for a
ucCount  => 1

pstStart => Array containing tokens for b
ucCount  => 1

pstStart => Array containing tokens for c
ucCount  => 1
```

Definition at line 83 of file [shell_support.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/shell_support.h](#)

13.62 PanelControl Class Reference

Inheritance diagram for PanelControl:

Public Member Functions

- virtual void **Init** ()
Initialize the control - must be called before use.
- virtual void **Draw** ()
Redraw the control "cleanly".
- virtual **GuiReturn_t** **ProcessEvent** (**GuiEvent_t** *pstEvent_)
Process an event sent to the control.
- virtual void **Activate** (bool bActivate_)
Activate or deactivate the current control - used when switching from one active control to another.
- void **SetColor** (COLOR eColor_)

Private Attributes

- COLOR **m_uColor**

Additional Inherited Members

13.62.1 Detailed Description

Definition at line 33 of file [control_panel.h](#).

13.62.2 Member Function Documentation

13.62.2.1 virtual void **PanelControl::Activate** (bool *bActivate_*) [inline],[virtual]

Activate or deactivate the current control - used when switching from one active control to another.

Parameters

<i>bActivate_</i>	- true to activate, false to deactivate
-------------------	-----------------------------------------

Implements [GuiControl](#).

Definition at line 39 of file [control_panel.h](#).

13.62.2.2 void **PanelControl::Draw** () [virtual]

Redraw the control "cleanly".

Subclass specific.

Implements [GuiControl](#).

Definition at line 26 of file [control_panel.cpp](#).

13.62.2.3 `virtual void PanelControl::Init () [inline],[virtual]`

Initialize the control - must be called before use.

Implementation is subclass specific.

Implements [GuiControl](#).

Definition at line 36 of file [control_panel.h](#).

13.62.2.4 `virtual GuiReturn_t PanelControl::ProcessEvent (GuiEvent_t * pstEvent_) [inline],[virtual]`

Process an event sent to the control.

Subclass specific implementation.

Parameters

<code>pstEvent_</code>	Pointer to a struct containing the event data
------------------------	-----------------------------------------------

Implements [GuiControl](#).

Definition at line 38 of file [control_panel.h](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/control_panel.h](#)
- [/home/moslevin/m3/embedded/stage/src/control_panel.cpp](#)

13.63 Profiler Class Reference

System profiling timer interface.

```
#include <kprofile.h>
```

Static Public Member Functions

- static void [Init](#) ()
Initialize the global system profiler.
- static void [Start](#) ()
Start the global profiling timer service.
- static void [Stop](#) ()
Stop the global profiling timer service.
- static K_USHORT [Read](#) ()
Read the current tick count in the timer.
- static void [Process](#) ()
Process the profiling counters from ISR.
- static K_ULONG [GetEpoch](#) ()
Return the current timer epoch.

Static Private Attributes

- static K_ULONG [m_ulEpoch](#)

13.63.1 Detailed Description

System profiling timer interface.

Definition at line 37 of file [kprofile.h](#).

13.63.2 Member Function Documentation

13.63.2.1 void Profiler::Init (void) [static]

Initialize the global system profiler.

Must be called prior to use.

Definition at line 32 of file [kprofile.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/kprofile.h](#)
- [/home/moslevin/m3/embedded/stage/src/kprofile.cpp](#)

13.64 ProfileTimer Class Reference

Profiling timer.

```
#include <profile.h>
```

Public Member Functions

- void [Init](#) ()
Initialize the profiling timer prior to use.
- void [Start](#) ()
Start a profiling session, if the timer is not already active.
- void [Stop](#) ()
Stop the current profiling session, adding to the cumulative time for this timer, and the total iteration count.
- K_ULONG [GetAverage](#) ()
Get the average time associated with this operation.
- K_ULONG [GetCurrent](#) ()
Return the current tick count held by the profiler.

Private Member Functions

- K_ULONG [ComputeCurrentTicks](#) (K_USHORT usCount_, K_ULONG ulEpoch_)
Figure out how many ticks have elapsed in this iteration.

Private Attributes

- K_ULONG [m_ulCumulative](#)
Cumulative tick-count for this timer.
- K_ULONG [m_ulCurrentIteration](#)
Tick-count for the current iteration.
- K_USHORT [m_usInitial](#)
Initial count.

- K_ULONG [m_ulInitialEpoch](#)
Initial Epoch.
- K_USHORT [m_usIterations](#)
Number of iterations executed for this profiling timer.
- K_UCHAR [m_bActive](#)
Whether or not the timer is active or stopped.

13.64.1 Detailed Description

Profiling timer.

This class is used to perform high-performance profiling of code to see how K_LONG certain operations take. Useful in instrumenting the performance of key algorithms and time-critical operations to ensure real-time behavior.

Definition at line 69 of file [profile.h](#).

13.64.2 Member Function Documentation

13.64.2.1 K_ULONG ProfileTimer::ComputeCurrentTicks (K_USHORT *usCount_*, K_ULONG *ulEpoch_*) [private]

Figure out how many ticks have elapsed in this iteration.

Parameters

<i>usCount_</i>	Current timer count
<i>ulEpoch_</i>	Current timer epoch

Returns

Current tick count

Definition at line 106 of file [profile.cpp](#).

13.64.2.2 K_ULONG ProfileTimer::GetAverage ()

Get the average time associated with this operation.

Returns

Average tick count normalized over all iterations

Definition at line 79 of file [profile.cpp](#).

13.64.2.3 K_ULONG ProfileTimer::GetCurrent ()

Return the current tick count held by the profiler.

Valid for both active and stopped timers.

Returns

The currently held tick count.

Definition at line 89 of file [profile.cpp](#).

13.64.2.4 void ProfileTimer::Init (void)

Initialize the profiling timer prior to use.

Can also be used to reset a timer that's been used previously.

Definition at line 37 of file [profile.cpp](#).

13.64.2.5 void ProfileTimer::Start (void)

Start a profiling session, if the timer is not already active.

Has no effect if the timer is already active.

Definition at line 46 of file [profile.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/profile.h](#)
- [/home/moslevin/m3/embedded/stage/src/profile.cpp](#)

13.65 ProgressControl Class Reference

Inheritance diagram for ProgressControl:

Public Member Functions

- virtual void [Init](#) ()
Initialiize the control - must be called before use.
- virtual void [Draw](#) ()
Redraw the control "cleanly".
- virtual [GuiReturn_t](#) [ProcessEvent](#) ([GuiEvent_t](#) *pstEvent_)
Process an event sent to the control.
- virtual void [Activate](#) (bool bActivate_)
Activate or deactivate the current control - used when switching from one active control to another.
- void **SetBackColor** (COLOR eColor_)
- void **SetProgressColor** (COLOR eColor_)
- void **SetBorderColor** (COLOR eColor_)
- void **SetProgress** (K_UCHAR ucProgress_)

Private Attributes

- COLOR **m_uBackColor**
- COLOR **m_uProgressColor**
- COLOR **m_uBorderColor**
- K_UCHAR **m_ucProgress**

Additional Inherited Members

13.65.1 Detailed Description

Definition at line 30 of file [control_progress.h](#).

13.65.2 Member Function Documentation

13.65.2.1 `virtual void ProgressControl::Activate (bool bActivate_) [inline], [virtual]`

Activate or deactivate the current control - used when switching from one active control to another.

Parameters

<i>bActivate_</i>	- true to activate, false to deactivate
-------------------	-----------------------------------------

Implements [GuiControl](#).

Definition at line 36 of file [control_progress.h](#).

13.65.2.2 `void ProgressControl::Draw () [virtual]`

Redraw the control "cleanly".

Subclass specific.

Implements [GuiControl](#).

Definition at line 36 of file [control_progress.cpp](#).

13.65.2.3 `void ProgressControl::Init () [virtual]`

Initialiize the control - must be called before use.

Implementation is subclass specific.

Implements [GuiControl](#).

Definition at line 27 of file [control_progress.cpp](#).

13.65.2.4 `GuiReturn_t ProgressControl::ProcessEvent (GuiEvent_t * pstEvent_) [virtual]`

Process an event sent to the control.

Subclass specific implementation.

Parameters

<i>pstEvent_</i>	Pointer to a struct containing the event data
------------------	-----------------------------------------------

Implements [GuiControl](#).

Definition at line 102 of file [control_progress.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/control_progress.h](#)
- [/home/moslevin/m3/embedded/stage/src/control_progress.cpp](#)

13.66 Quantum Class Reference

Static-class used to implement [Thread](#) quantum functionality, which is a key part of round-robin scheduling.

```
#include <quantum.h>
```

Static Public Member Functions

- static void [UpdateTimer](#) ()
This function is called to update the thread quantum timer whenever something in the scheduler has changed.
- static void [AddThread](#) ([Thread](#) **pciThread_*)
Add the thread to the quantum timer.
- static void [RemoveThread](#) ()
Remove the thread from the quantum timer.

Static Private Member Functions

- static void [SetTimer](#) ([Thread](#) **pciThread_*)
Set up the quantum timer in the timer scheduler.

Static Private Attributes

- static [Timer](#) **m_clQuantumTimer**
- static K_UCHAR **m_bActive**

13.66.1 Detailed Description

Static-class used to implement [Thread](#) quantum functionality, which is a key part of round-robin scheduling.

Definition at line [39](#) of file [quantum.h](#).

13.66.2 Member Function Documentation

13.66.2.1 void Quantum::AddThread ([Thread](#) * *pciThread_*) [static]

Add the thread to the quantum timer.

Only one thread can own the quantum, since only one thread can be running on a core at a time.

Definition at line [70](#) of file [quantum.cpp](#).

13.66.2.2 void Quantum::RemoveThread (void) [static]

Remove the thread from the quantum timer.

This will cancel the timer.

Definition at line [87](#) of file [quantum.cpp](#).

13.66.2.3 void Quantum::SetTimer ([Thread](#) * *pciThread_*) [static], [private]

Set up the quantum timer in the timer scheduler.

This creates a one-shot timer, which calls a static callback in [quantum.cpp](#) that on expiry will pivot the head of the threadlist for the thread's priority. This is the mechanism that provides round-robin scheduling in the system.

Parameters

<code>pclThread_</code>	Pointer to the thread to set the Quantum timer on
-------------------------	-------------------------------------------------------------------

Definition at line 60 of file [quantum.cpp](#).

13.66.2.4 void Quantum::UpdateTimer (void) [static]

This function is called to update the thread quantum timer whenever something in the scheduler has changed.

This can result in the timer being re-loaded or started. The timer is never stopped, but it may be ignored on expiry.

Definition at line 100 of file [quantum.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/quantum.h](#)
- [/home/moslevin/m3/embedded/stage/src/quantum.cpp](#)

13.67 Scheduler Class Reference

Priority-based round-robin [Thread](#) scheduling, using ThreadLists for housekeeping.

```
#include <scheduler.h>
```

Static Public Member Functions

- static void [Init](#) ()
Intialize the scheduler, must be called before use.
- static void [Schedule](#) ()
Run the scheduler, determines the next thread to run based on the current state of the threads.
- static void [Add](#) ([Thread](#) *pclThread_)
Add a thread to the scheduler at its current priority level.
- static void [Remove](#) ([Thread](#) *pclThread_)
Remove a thread from the scheduler at its current priority level.
- static void [SetScheduler](#) (K_UCHAR bEnable_)
Set the active state of the scheduler.
- static [Thread](#) * [GetCurrentThread](#) ()
Return the pointer to the currently-running thread.
- static [Thread](#) * [GetNextThread](#) ()
Return the pointer to the thread that should run next, according to the last run of the scheduler.
- static [ThreadList](#) * [GetThreadList](#) (K_UCHAR ucPriority_)
Return the pointer to the active list of threads that are at the given priority level in the scheduler.
- static [ThreadList](#) * [GetStopList](#) ()
Return the pointer to the list of threads that are in the scheduler's stopped state.
- static K_UCHAR [IsEnabled](#) ()
Return the current state of the scheduler - whether or not scheudling is enabled or disabled.

Static Private Attributes

- static K_UCHAR [m_bEnabled](#)
Scheduler's state - enabled or disabled.
- static [ThreadList](#) [m_clStopList](#)

- [ThreadList](#) for all stopped threads.
- static [ThreadList](#) [m_aclPriorities](#) [NUM_PRIORITIES]
ThreadLists for all threads at all priorities.
- static K_UCHAR [m_ucPriFlag](#)
Bitmap flag for each.

13.67.1 Detailed Description

Priority-based round-robin [Thread](#) scheduling, using ThreadLists for housekeeping.

Definition at line 61 of file [scheduler.h](#).

13.67.2 Member Function Documentation

13.67.2.1 void Scheduler::Add (Thread * [pclThread_](#)) [static]

Add a thread to the scheduler at its current priority level.

Parameters

pclThread_	Pointer to the thread to add to the scheduler
----------------------------	-----------------------------------------------

Definition at line 77 of file [scheduler.cpp](#).

13.67.2.2 static Thread* Scheduler::GetCurrentThread () [inline],[static]

Return the pointer to the currently-running thread.

Returns

Pointer to the currently-running thread

Definition at line 118 of file [scheduler.h](#).

13.67.2.3 static Thread* Scheduler::GetNextThread () [inline],[static]

Return the pointer to the thread that should run next, according to the last run of the scheduler.

Returns

Pointer to the next-running thread

Definition at line 126 of file [scheduler.h](#).

13.67.2.4 static ThreadList* Scheduler::GetStopList () [inline],[static]

Return the pointer to the list of threads that are in the scheduler's stopped state.

Returns

Pointer to the [ThreadList](#) containing the stopped threads

Definition at line 144 of file [scheduler.h](#).

13.67.2.5 `static ThreadList* Scheduler::GetThreadList (K_UCHAR ucPriority_) [inline],[static]`

Return the pointer to the active list of threads that are at the given priority level in the scheduler.

Parameters

<i>ucPriority_</i>	Priority level of
--------------------	-------------------

Returns

Pointer to the [ThreadList](#) for the given priority level

Definition at line 136 of file [scheduler.h](#).

13.67.2.6 `K_UCHAR Scheduler::IsEnabled () [inline],[static]`

Return the current state of the scheduler - whether or not scheduling is enabled or disabled.

Returns

true - scheduler enabled, false - disabled

Definition at line 154 of file [scheduler.h](#).

13.67.2.7 `void Scheduler::Remove (Thread * pclThread_) [static]`

Remove a thread from the scheduler at its current priority level.

Parameters

<i>pclThread_</i>	Pointer to the thread to be removed from the scheduler
-------------------	--------------------------------------------------------

Definition at line 84 of file [scheduler.cpp](#).

13.67.2.8 `Scheduler::Schedule () [static]`

Run the scheduler, determines the next thread to run based on the current state of the threads.

Note that the next-thread chosen from this function is only valid while in a critical section.

Definition at line 60 of file [scheduler.cpp](#).

13.67.2.9 `void Scheduler::SetScheduler (K_UCHAR bEnable_) [inline],[static]`

Set the active state of the scheduler.

When the scheduler is disabled, the *next thread* is never set; the currently running thread will run forever until the scheduler is enabled again. Care must be taken to ensure that we don't end up trying to block while the scheduler is disabled, otherwise the system ends up in an unusable state.

Parameters

<i>bEnable_</i>	true to enable, false to disable the scheduler
-----------------	------------------------------------------------

Definition at line 111 of file [scheduler.h](#).

The documentation for this class was generated from the following files:

- </home/moslevin/m3/embedded/stage/src/scheduler.h>
- </home/moslevin/m3/embedded/stage/src/scheduler.cpp>

13.68 Screen Class Reference

Inheritance diagram for Screen:

Public Member Functions

- void [Activate](#) ()
This is called when a new screen needs to be created.
- void [Deactivate](#) ()
This is called when a screen is torn-down.
- void [SetWindowAffinity](#) (const K_CHAR *szWindowName_)
Indicate by name which window this screen is to be bound.
- void [SetName](#) (const K_CHAR *szName_)
Set the name of the current screen.
- const K_CHAR * [GetName](#) ()
Return the name of the current screen.

Protected Member Functions

- void [SetManager](#) ([ScreenManager](#) *pclScreenManager_)
Function called by the [ScreenManager](#) to set the screen affinity.

Protected Attributes

- const K_CHAR * **m_szName**
- [ScreenManager](#) * **m_pclScreenManager**
- [GuiWindow](#) * **m_pclWindow**

Private Member Functions

- virtual void **Create** ()=0
- virtual void **Destroy** ()=0

Friends

- class **ScreenManager**

13.68.1 Detailed Description

Definition at line 31 of file [screen.h](#).

13.68.2 Member Function Documentation

13.68.2.1 void Screen::Activate () [inline]

This is called when a new screen needs to be created.

This calls the underlying virtual "create" method, which performs all control object initialization and allocation. Calling a redraw(true) on the bound window will result in the new window being rendered to display.

Definition at line 40 of file [screen.h](#).

13.68.2.2 void Screen::Deactivate () [inline]

This is called when a screen is torn-down.

Essentially removes the controls from the named window and deallocates any memory used to build up the screen.

Definition at line 47 of file [screen.h](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/screen.h](#)
- [/home/moslevin/m3/embedded/stage/src/screen.cpp](#)

13.69 ScreenList Class Reference

Public Member Functions

- void [Add](#) ([Screen](#) *pclScreen_)
Add a screen to the screen list.
- void [Remove](#) ([Screen](#) *pclScreen_)
Remove a screen from the screen list.
- [Screen](#) * [GetHead](#) ()
Get the beginning of the screen list.

Private Attributes

- [DoubleLinkedList](#) [m_clList](#)
Double link-list used to manage screen objects.

13.69.1 Detailed Description

Definition at line 84 of file [screen.h](#).

The documentation for this class was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/screen.h](#)

13.70 ScreenManager Class Reference

Public Member Functions

- void [AddScreen](#) ([Screen](#) *pclScreen_)
Add a new screen to the screen manager.

- void [RemoveScreen](#) ([Screen](#) *pclScreen_)
Remove an existing screen from the screen manager.
- void [SetEventSurface](#) ([GuiEventSurface](#) *pclSurface_)
Set the event surface on which this screen manager's screens will be displayed.
- [GuiWindow](#) * [FindWindowByName](#) (const K_CHAR *m_szName_)
Return a pointer to a window by name.
- [Screen](#) * [FindScreenByName](#) (const K_CHAR *m_szName_)
Return a pointer to a screen by name.

Private Attributes

- [ScreenList](#) m_clScreenList
Screen list object used to manage individual screens.
- [GuiEventSurface](#) * m_pclSurface
Pointer to the GUI Event Surface on which the screens are displayed.

13.70.1 Detailed Description

Definition at line 109 of file [screen.h](#).

The documentation for this class was generated from the following files:

- /home/moslevin/m3/embedded/stage/src/[screen.h](#)
- /home/moslevin/m3/embedded/stage/src/[screen.cpp](#)

13.71 Semaphore Class Reference

Counting semaphore, based on [BlockingObject](#) base class.

```
#include <ksemaphore.h>
```

Inheritance diagram for Semaphore:

Public Member Functions

- void [Init](#) (K_USHORT usInitVal_, K_USHORT usMaxVal_)
Initialize a semaphore before use.
- bool [Post](#) ()
Increment the semaphore count.
- void [Pend](#) ()
Decrement the semaphore count.
- K_USHORT [GetCount](#) ()
Return the current semaphore counter.
- bool [Pend](#) (K_ULONG ulWaitTimeMS_)
Decrement the semaphore count.

- void [WakeMe](#) ([Thread](#) *pclChosenOne_)
Wake a thread blocked on the semaphore.
- void [SetExpired](#) (bool bExpired_)
Set the semaphore expired flag on this object.
- bool [GetExpired](#) ()

Private Member Functions

- [K_UCHAR WakeNext](#) ()
Wake the next thread waiting on the semaphore.

Private Attributes

- [K_USHORT m_usValue](#)
- [K_USHORT m_usMaxValue](#)
- [bool m_bExpired](#)

Additional Inherited Members

13.71.1 Detailed Description

Counting semaphore, based on [BlockingObject](#) base class.

Definition at line 37 of file [ksemaphore.h](#).

13.71.2 Member Function Documentation

13.71.2.1 [K_USHORT Semaphore::GetCount](#) ()

Return the current semaphore counter.

This can be used by a thread to bypass blocking on a semaphore - allowing it to do other things until a non-zero count is returned, instead of blocking until the semaphore is posted.

Returns

The current semaphore counter value.

Definition at line 227 of file [ksemaphore.cpp](#).

13.71.2.2 [void Semaphore::Init](#) ([K_USHORT usInitVal_](#), [K_USHORT usMaxVal_](#))

Initialize a semaphore before use.

Must be called before post/pend operations.

Parameters

usInitVal_	Initial value held by the semaphore
usMaxVal_	Maximum value for the semaphore

Definition at line 84 of file [ksemaphore.cpp](#).

13.71.2.3 void Semaphore::Pend ()

Decrement the semaphore count.

If the count is zero, the thread will block until the semaphore is pended.

Definition at line 156 of file [ksemaphore.cpp](#).

13.71.2.4 bool Semaphore::Pend (K_ULONG uWaitTimeMS_)

Decrement the semaphore count.

If the count is zero, the thread will block until the semaphore is pended. If the specified interval expires before the thread is unblocked, then the status is returned back to the user.

Returns

true - semaphore was acquired before the timeout false - timeout occurred before the semaphore was claimed.

Definition at line 161 of file [ksemaphore.cpp](#).

13.71.2.5 void Semaphore::Post ()

Increment the semaphore count.

Returns

true if the semaphore was posted, false if the count is already maxed out.

Definition at line 98 of file [ksemaphore.cpp](#).

13.71.2.6 void Semaphore::SetExpired (bool bExpired_) [inline]

Set the semaphore expired flag on this object.

\

Definition at line 115 of file [ksemaphore.h](#).

13.71.2.7 void Semaphore::WakeMe (Thread * pChosenOne_)

Wake a thread blocked on the semaphore.

This is an internal function used for implementing timed semaphores relying on timer callbacks. Since these do not have access to the private data of the semaphore and its base classes, we have to wrap this as a public method - do not use this for any other purposes.

Definition at line 57 of file [ksemaphore.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/ksemaphore.h](#)
- [/home/moslevin/m3/embedded/stage/src/ksemaphore.cpp](#)

13.72 ShellCommand_t Struct Reference

Data structure defining a lookup table correlating a command name to its handler function.

```
#include <shell_support.h>
```

Public Attributes

- `const K_CHAR * szCommand`
Command name.
- `fp_internal_command pfHandler`
Command handler function.

13.72.1 Detailed Description

Data structure defining a lookup table correlating a command name to its handler function.

Definition at line 117 of file [shell_support.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/shell_support.h](#)

13.73 ShellSupport Class Reference

The [ShellSupport](#) class features utility functions which handle token processing, option/parameter lookup, and functions making it generally trivial to implement a lightweight custom shell.

```
#include <shell_support.h>
```

Static Public Member Functions

- static `K_CHAR RunCommand (CommandLine_t *pstCommand_, const ShellCommand_t *pstShellCommands_)`
RunCommand Given a command-line, attempts to run the corresponding shell command based where it exists within the supplied ShellCommand_t array.
- static void `UnescapeToken (Token_t *pstToken_, K_CHAR *szDest_)`
UnescapeToken Convert a token which has special parsing characters in it to a "flattened" string, where all unescaped double quotes and escaped tab, newline, space, etc.
- static `Option_t * CheckForOption (CommandLine_t *pstCommand_, const K_CHAR *szOption_)`
CheckForOption Check to see whether or not a specific option has been set within the commandline arguments.
- static `K_CHAR TokensToCommandLine (Token_t *pstTokens_, K_UCHAR ucTokens_, CommandLine_t *pstCommand_)`
TokensToCommandLine Convert an array of tokens to a commandline object.

13.73.1 Detailed Description

The [ShellSupport](#) class features utility functions which handle token processing, option/parameter lookup, and functions making it generally trivial to implement a lightweight custom shell.

Definition at line 129 of file [shell_support.h](#).

13.73.2 Member Function Documentation

13.73.2.1 `Option_t * ShellSupport::CheckForOption (CommandLine_t * pstCommand_, const K_CHAR * szOption_)` [static]

CheckForOption Check to see whether or not a specific option has been set within the commandline arguments.

Parameters

<i>pstCommand_</i>	Pointer to the commandline object containing the options
<i>szOption_</i>	0-terminated string corresponding to the command-line option.

Returns

Pointer to the command line option on match, or 0 on failure.

Definition at line 104 of file [shell_support.cpp](#).

13.73.2.2 `K_CHAR ShellSupport::RunCommand (CommandLine_t * pstCommand_, const ShellCommand_t *
pstShellCommands_) [static]`

RunCommand Given a command-line, attempts to run the corresponding shell command based where it exists within the supplied [ShellCommand_t](#) array.

Parameters

<i>pstCommand_</i>	Pointer to the command-line to execute
<i>pstCommands_</i>	Pointer to an array of shell commands to execute against

Returns

1 on success, 0 on error (command not found)

Definition at line 28 of file [shell_support.cpp](#).

13.73.2.3 `K_CHAR ShellSupport::TokensToCommandLine (Token_t * pstTokens_, K_UCHAR ucTokens_,
CommandLine_t * pstCommand_) [static]`

TokensToCommandLine Convert an array of tokens to a commandline object.

This operation is non-destructive to the source token array.

Parameters

<i>pstTokens_</i>	Pointer to the token array to process
<i>ucTokens_</i>	Number of tokens in the token array
<i>pstCommand_</i>	Pointer to the CommandLine_t object which will represent the shell command and its arguments.

Returns

Number of options processed

Definition at line 123 of file [shell_support.cpp](#).

13.73.2.4 `void ShellSupport::UnescapeToken (Token_t * pstToken_, K_CHAR * szDest_) [static]`

UnescapeToken Convert a token which has special parsing characters in it to a "flattened" string, where all unescaped double quotes and escaped tab, newline, space, etc.

characters are converted into their ascii-code equivalents.

Parameters

<code>pstToken_</code>	Pointer to the source token to convert
<code>szDest_</code>	Pointer to a destination string which will contain the parsed result string

Definition at line 49 of file [shell_support.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/shell_support.h](#)
- [/home/moslevin/m3/embedded/stage/src/shell_support.cpp](#)

13.74 SlickButtonControl Class Reference

Inheritance diagram for SlickButtonControl:

Public Member Functions

- virtual void [Init](#) ()
Initialize the control - must be called before use.
- virtual void [Draw](#) ()
Redraw the control "cleanly".
- virtual [GuiReturn_t](#) [ProcessEvent](#) ([GuiEvent_t](#) *pstEvent_)
Process an event sent to the control.
- virtual void [Activate](#) (bool bActivate_)
Activate or deactivate the current control - used when switching from one active control to another.
- void [SetFont](#) ([Font_t](#) *pstFont_)
- void [SetCaption](#) (const K_CHAR *szCaption_)
- void [SetCallback](#) (ButtonCallback pfCallback_, void *pvData_)

Private Attributes

- const K_CHAR * [m_szCaption](#)
- [Font_t](#) * [m_pstFont](#)
- bool [m_bState](#)
- K_UCHAR [m_ucTimeout](#)
- void * [m_pvCallbackData](#)
- ButtonCallback [m_pfCallback](#)

Additional Inherited Members

13.74.1 Detailed Description

Definition at line 32 of file [control_slickbutton.h](#).

13.74.2 Member Function Documentation

13.74.2.1 void SlickButtonControl::Activate (bool *bActivate_*) [virtual]

Activate or deactivate the current control - used when switching from one active control to another.

Parameters

<i>bActivate_</i>	- true to activate, false to deactivate
-------------------	-----------------------------------------

Implements [GuiControl](#).

Definition at line 286 of file [control_slickbutton.cpp](#).

13.74.2.2 void SlickButtonControl::Draw () [virtual]

Redraw the control "cleanly".

Subclass specific.

Implements [GuiControl](#).

Definition at line 51 of file [control_slickbutton.cpp](#).

13.74.2.3 void SlickButtonControl::Init () [virtual]

Initialiize the control - must be called before use.

Implementation is subclass specific.

Implements [GuiControl](#).

Definition at line 40 of file [control_slickbutton.cpp](#).

13.74.2.4 GuiReturn_t SlickButtonControl::ProcessEvent (GuiEvent_t* *pstEvent_*) [virtual]

Process an event sent to the control.

Subclass specific implementation.

Parameters

<i>pstEvent_</i>	Pointer to a struct containing the event data
------------------	-----------------------------------------------

Implements [GuiControl](#).

Definition at line 164 of file [control_slickbutton.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/control_slickbutton.h](#)
- [/home/moslevin/m3/embedded/stage/src/control_slickbutton.cpp](#)

13.75 SlickGroupBoxControl Class Reference

Inheritance diagram for SlickGroupBoxControl:

Public Member Functions

- virtual void **Init** ()
Initialiize the control - must be called before use.
- virtual void **Draw** ()
Redraw the control "cleanly".
- virtual **GuiReturn_t ProcessEvent** (**GuiEvent_t** *pstEvent_)
Process an event sent to the control.
- virtual void **Activate** (bool bActivate_)
Activate or deactivate the current control - used when switching from one active control to another.
- void **SetFont** (**Font_t** *pstFont_)
- void **SetCaption** (const K_CHAR *pcCaption_)
- void **SetBGColor** (COLOR uColor_)

Private Attributes

- COLOR **m_uBGColor**

Additional Inherited Members

13.75.1 Detailed Description

Definition at line 29 of file [control_slickgroupbox.h](#).

13.75.2 Member Function Documentation

13.75.2.1 virtual void SlickGroupBoxControl::Activate (bool bActivate_) [inline],[virtual]

Activate or deactivate the current control - used when switching from one active control to another.

Parameters

<i>bActivate_</i>	- true to activate, false to deactivate
-------------------	-----------------------------------------

Implements [GuiControl](#).

Definition at line 35 of file [control_slickgroupbox.h](#).

13.75.2.2 void SlickGroupBoxControl::Draw () [virtual]

Redraw the control "cleanly".

Subclass specific.

Implements [GuiControl](#).

Definition at line 31 of file [control_slickgroupbox.cpp](#).

13.75.2.3 `virtual void SlickGroupBoxControl::Init () [inline],[virtual]`

Initialize the control - must be called before use.

Implementation is subclass specific.

Implements [GuiControl](#).

Definition at line 32 of file [control_slickgroupbox.h](#).

13.75.2.4 `virtual GuiReturn_t SlickGroupBoxControl::ProcessEvent (GuiEvent_t * pstEvent_) [inline],[virtual]`

Process an event sent to the control.

Subclass specific implementation.

Parameters

<code>pstEvent_</code>	Pointer to a struct containing the event data
------------------------	-----------------------------------------------

Implements [GuiControl](#).

Definition at line 34 of file [control_slickgroupbox.h](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/control_slickgroupbox.h](#)
- [/home/moslevin/m3/embedded/stage/src/control_slickgroupbox.cpp](#)

13.76 SlickProgressControl Class Reference

Inheritance diagram for SlickProgressControl:

Public Member Functions

- `virtual void Init ()`
Initialiize the control - must be called before use.
- `virtual void Draw ()`
Redraw the control "cleanly".
- `virtual GuiReturn_t ProcessEvent (GuiEvent_t *pstEvent_)`
Process an event sent to the control.

- virtual void [Activate](#) (bool bActivate_)
Activate or deactivate the current control - used when switching from one active control to another.
- void **SetProgress** (K_UCHAR ucProgress_)

Private Attributes

- K_UCHAR **m_ucProgress**

Additional Inherited Members

13.76.1 Detailed Description

Definition at line 30 of file [control_slickprogress.h](#).

13.76.2 Member Function Documentation

13.76.2.1 virtual void SlickProgressControl::Activate (bool *bActivate_*) [inline], [virtual]

Activate or deactivate the current control - used when switching from one active control to another.

Parameters

<i>bActivate_</i>	- true to activate, false to deactivate
-------------------	-----------------------------------------

Implements [GuiControl](#).

Definition at line 36 of file [control_slickprogress.h](#).

13.76.2.2 void SlickProgressControl::Draw () [virtual]

Redraw the control "cleanly".

Subclass specific.

Implements [GuiControl](#).

Definition at line 33 of file [control_slickprogress.cpp](#).

13.76.2.3 void SlickProgressControl::Init () [virtual]

Initialize the control - must be called before use.

Implementation is subclass specific.

Implements [GuiControl](#).

Definition at line 27 of file [control_slickprogress.cpp](#).

13.76.2.4 GuiReturn_t SlickProgressControl::ProcessEvent (GuiEvent_t * *pstEvent_*) [virtual]

Process an event sent to the control.

Subclass specific implementation.

Parameters

<i>pstEvent_</i>	Pointer to a struct containing the event data
------------------	-----------------------------------------------

Implements [GuiControl](#).

Definition at line 107 of file [control_slickprogress.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/control_slickprogress.h](#)
- [/home/moslevin/m3/embedded/stage/src/control_slickprogress.cpp](#)

13.77 Slip Class Reference

Object used to frame communications over an abstract device using the serial-line internet protocol (SLIP).

```
#include <slip.h>
```

Public Member Functions

- void [SetDriver](#) ([Driver](#) *pclDriver_)
Set the driver to attach to this object.
- [Driver](#) * [GetDriver](#) ()
Return the pointer to the driver attached to this object.
- void [WriteData](#) (K_UCHAR ucChannel_, const K_CHAR *aucBuf_, K_USHORT usLen_)
Write a packet of data in the FunkenSlip format.
- K_USHORT [ReadData](#) (K_UCHAR *pucChannel_, K_CHAR *aucBuf_, K_USHORT usLen_)
Read a packet from a specified device, parse, and copy to a specified output buffer.
- void [WriteVector](#) (K_UCHAR ucChannel_, [SlipDataVector](#) *astData_, K_USHORT usLen_)
Write a single message composed of multiple data-vector fragments.
- void [SendAck](#) ()
Send an acknowledgement character to the host.
- void [SendNack](#) ()
Send a negative-acknowledgement character to the host.

Static Public Member Functions

- static K_USHORT [EncodeByte](#) (K_UCHAR ucChar_, K_UCHAR *aucBuf_)
Encode a single byte into a stream, returning the size of the encoded value (either 1 or 2 bytes).
- static K_USHORT [DecodeByte](#) (K_UCHAR *ucChar_, const K_UCHAR *aucBuf_)
Decode a byte from a stream into a specified value.

Private Member Functions

- void [WriteByte](#) (K_UCHAR ucData_)

Private Attributes

- [Driver](#) * [m_pclDriver](#)

13.77.1 Detailed Description

Object used to frame communications over an abstract device using the serial-line internet protocol (SLIP).

Definition at line 70 of file [slip.h](#).

13.77.2 Member Function Documentation

13.77.2.1 K_USHORT Slip::DecodeByte (K_UCHAR * *ucChar_*, const K_UCHAR * *aucBuf_*) [static]

Decode a byte from a stream into a specified value.

Returns the number of bytes from the source array that were processed, (1 or 2), or 0 if an end-of-packet (192) was encountered.

Parameters

<i>ucChar_</i>	Destination K_CHAR
<i>aucBuf_</i>	Source buffer

Returns

bytes read, or 0 on terminating character (192)

Definition at line 56 of file [slip.cpp](#).

13.77.2.2 K_USHORT Slip::EncodeByte (K_UCHAR *ucChar_*, K_UCHAR * *aucBuf_*) [static]

Encode a single byte into a stream, returning the size of the encoded value (either 1 or 2 bytes).

Parameters

<i>ucChar_</i>	Character to encode
<i>aucBuf_</i>	Buffer to encode into

Returns

bytes read

Definition at line 34 of file [slip.cpp](#).

13.77.2.3 Driver* Slip::GetDriver () [inline]

Return the pointer to the driver attached to this object.

Returns

Pointer to the driver attached

Definition at line 85 of file [slip.h](#).

13.77.2.4 K_USHORT Slip::ReadData (K_UCHAR * *pucChannel_*, K_CHAR * *aucBuf_*, K_USHORT *usLen_*)

Read a packet from a specified device, parse, and copy to a specified output buffer.

Parameters

<i>pucChannel_</i>	Pointer to a uchar that stores the message channel
<i>aucBuf_</i>	Buffer where the message will be decoded
<i>usLen_</i>	Length of the buffer to decode

Returns

data bytes read, 0 on failure.

Definition at line 104 of file [slip.cpp](#).

13.77.2.5 void Slip::SetDriver (Driver * *pclDriver_*) [inline]

Set the driver to attach to this object.

Parameters

<i>pclDriver_</i>	Pointer to the driver to attach
-------------------	---------------------------------

Definition at line 78 of file [slip.h](#).

13.77.2.6 void Slip::WriteData (K_UCHAR *ucChannel_*, const K_CHAR * *aucBuf_*, K_USHORT *usLen_*)

Write a packet of data in the FunkenSlip format.

Returns the number of bytes from the source array that were processed, (1 or 2), or 0 if an end-of-packet (192) was encountered.

Parameters

<i>ucChannel_</i>	Channel to encode the packet to
<i>aucBuf_</i>	Payload to encode
<i>usLen_</i>	Length of payload data

Definition at line 164 of file [slip.cpp](#).

13.77.2.7 void Slip::WriteVector (K_UCHAR *ucChannel_*, SlipDataVector * *astData_*, K_USHORT *usLen_*)

Write a single message composed of multiple data-vector fragments.

Allows for transmitting complex data structures without requiring buffering. This operation is zero-copy.

Parameters

<i>ucChannel_</i>	Message channel
<i>astData_</i>	Pointer to the data vector
<i>usLen_</i>	Number of elements in the data vector

Definition at line 223 of file [slip.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/slip.h](#)
- [/home/moslevin/m3/embedded/stage/src/slip.cpp](#)

13.78 SlipDataVector Struct Reference

Data structure used for vector-based SLIP data transmission.

```
#include <slip.h>
```

Public Attributes

- K_UCHAR [ucSize](#)
Size of the data buffer.
- K_UCHAR * [pucData](#)
Pointer to the data buffer.

13.78.1 Detailed Description

Data structure used for vector-based SLIP data transmission.

Allows for building and transmitting complex data structures without having to copy data into intermediate buffers.

Definition at line 59 of file [slip.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/slip.h](#)

13.79 SlipMux Class Reference

Static-class which implements a multiplexed stream of SLIP data over a single interface.

```
#include <slip_mux.h>
```

Static Public Member Functions

- static void [Init](#) (const K_CHAR *pcDriverPath_, K_USHORT usRxSize_, K_UCHAR *aucRx_, K_USHORT usTxSize_, K_UCHAR *aucTx_)
Attach a driver to the Slip-stream multiplexer and initialize the internal data associated with the module.
- static void [InstallHandler](#) (K_UCHAR ucChannel_, Slip_Channel pfHandler_)
Install a slip handler function for the given communication channel.
- static void [MessageReceive](#) ()
Wait for a valid packet to arrive, and call the appropriate handler function for the channel the message was attached to.
- static Driver * [GetDriver](#) ()
Return the pointer of the current driver used by the [SlipMux](#) module.
- static MessageQueue * [GetQueue](#) ()
Return the pointer to the message queue attached to the slip mux channel.
- static void [SetQueue](#) (MessageQueue *pclMessageQueue_)
Set the message queue that will receive the notification when the slip mux channel has received data.
- static Slip * [GetSlip](#) ()
Return the pointer to the [SlipMux](#)' Slip object.

Static Private Attributes

- static MessageQueue * [m_pclMessageQueue](#)
- static Driver * [m_pclDriver](#)
- static Slip_Channel [m_apfChannelHandlers](#) [SLIP_CHANNEL_COUNT] = {0}
- static K_UCHAR [m_aucData](#) [SLIP_BUFFER_SIZE]
- static Semaphore [m_clSlipSem](#)
- static Slip [m_clSlip](#)

13.79.1 Detailed Description

Static-class which implements a multiplexed stream of SLIP data over a single interface.

Definition at line 43 of file [slip_mux.h](#).

13.79.2 Member Function Documentation

13.79.2.1 static Driver* SlipMux::GetDriver () [inline],[static]

Return the pointer of the current driver used by the [SlipMux](#) module.

Returns

Pointer to the current handle owned by [SlipMux](#)

Definition at line 91 of file [slip_mux.h](#).

13.79.2.2 static MessageQueue* SlipMux::GetQueue () [inline],[static]

Return the pointer to the message queue attached to the slip mux channel.

Returns

Pointer to the message Queue

Definition at line 99 of file [slip_mux.h](#).

13.79.2.3 static Slip* SlipMux::GetSlip () [inline],[static]

Return the pointer to the [SlipMux](#)' [Slip](#) object.

Returns

Pointer to the [Slip](#) object

Definition at line 117 of file [slip_mux.h](#).

13.79.2.4 void SlipMux::Init (const K_CHAR * pcDriverPath_, K_USHORT usRxSize_, K_UCHAR * aucRx_, K_USHORT usTxSize_, K_UCHAR * aucTx_) [static]

Attach a driver to the Slip-stream multiplexer and initialize the internal data associated with the module.

Must be called before any of the other functions in this module are called.

Parameters

<i>pcDriverPath_</i>	Filesystem path to the driver to attach to
<i>usRxSize_</i>	Size of the RX Buffer to attach to the driver
<i>aucRx_</i>	Pointer to the RX Buffer to attach to the driver
<i>usTxSize_</i>	Size of the TX Buffer to attach to the driver
<i>aucTx_</i>	Pointer to the TX Buffer to attach to the driver

Definition at line 59 of file [slip_mux.cpp](#).

13.79.2.5 void SlipMux::InstallHandler (K_UCHAR ucChannel_, Slip_Channel pfHandler_) [static]

Install a slip handler function for the given communication channel.

Parameters

<i>ucChannel_</i>	Channel to attach the handler to
<i>pfHandler_</i>	Pointer to the handler function to attach

Definition at line 76 of file [slip_mux.cpp](#).

13.79.2.6 void SlipMux::MessageReceive (void) [static]

Wait for a valid packet to arrive, and call the appropriate handler function for the channel the message was attached to.

This is essentially the entry point for a thread whose purpose is to service slip Rx data.

Definition at line 85 of file [slip_mux.cpp](#).

13.79.2.7 static void SlipMux::SetQueue (MessageQueue * pciMessageQueue_) [inline],[static]

Set the message queue that will receive the notification when the slip mux channel has received data.

Parameters

<i>pciMessageQueue_</i>	Pointer to the message queue to use for notification.
-------------------------	-------------------------------------------------------

Definition at line 108 of file [slip_mux.h](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/slip_mux.h](#)
- [/home/moslevin/m3/embedded/stage/src/slip_mux.cpp](#)

13.80 SlipTerm Class Reference

Class implementing a simple debug terminal interface.

```
#include <slipterm.h>
```

Public Member Functions

- void [Init](#) ()
Initialize the terminal by opening a handle to the serial interface attached at /dev/tty.
- void [PrintLn](#) (const char *szLine_)
Print a string of text to the SLIP interface, multiplexed using the FunkenSlip terminal channel.
- void [PrintLn](#) (K_UCHAR ucSeverity_, const char *szLine_)
Print a string of text to the SLIP interface, but only if the current logging verbosity level is greater than or equal to the specified message severity.
- void [SetVerbosity](#) (K_UCHAR ucLevel_)
Set the logging verbosity level - the minimum severity level that will be printed to the terminal.

Private Member Functions

- K_USHORT [StrLen](#) (const char *szString_)
Quick 'n' dirty StrLen functionality used for printing the string.

Private Attributes

- K_UCHAR [m_ucVerbosity](#)
- [Slip](#) [m_slSlip](#)
Slip object that this module interfaces with.

13.80.1 Detailed Description

Class implementing a simple debug terminal interface.

This is useful for printf style debugging.

Definition at line 40 of file [slipterm.h](#).

13.80.2 Member Function Documentation

13.80.2.1 void SlipTerm::Init (void)

Initialize the terminal by opening a handle to the serial interface attached at /dev/tty.

Must be called prior to using the print functionality.

Definition at line 26 of file [slipterm.cpp](#).

13.80.2.2 void SlipTerm::PrintLn (const char * szLine_)

Print a string of text to the SLIP interface, multiplexed using the FunkenSlip terminal channel.

Parameters

szLine_	String to print
-------------------------	-----------------

Definition at line 44 of file [slipterm.cpp](#).

13.80.2.3 void SlipTerm::PrintLn (K_UCHAR ucSeverity_, const char * szLine_)

Print a string of text to the SLIP interface, but only if the current logging verbosity level is greater than or equal to the specified message severity.

Parameters

ucSeverity_	Message severity level, 0 = highest severity
szLine_	String to print

Definition at line 56 of file [slipterm.cpp](#).

13.80.2.4 void SlipTerm::SetVerbosity (K_UCHAR ucLevel_) [inline]

Set the logging verbosity level - the minimum severity level that will be printed to the terminal.

The higher the number, the more chatty the output.

Definition at line 81 of file [slipterm.h](#).

13.80.2.5 K_USHORT SlipTerm::StrLen (const char * szString_) [private]

Quick 'n' dirty StrLen functionality used for printing the string.

Returns

Length of the string (in bytes)

Definition at line 33 of file [slipterm.cpp](#).

13.80.3 Member Data Documentation

13.80.3.1 K_UCHAR SlipTerm::m_ucVerbosity [private]

Verbosity level. Messages with a severity

level greater than this Are not displayed.

Definition at line 92 of file [slipterm.h](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/slipterm.h](#)
- [/home/moslevin/m3/embedded/stage/src/slipterm.cpp](#)

13.81 StubControl Class Reference

Stub control class, used for testing out the GUI framework where certain controls have not yet been implemented.

```
#include <gui.h>
```

Inheritance diagram for StubControl:

Public Member Functions

- virtual void [Init](#) ()
Initialiize the control - must be called before use.
- virtual void [Draw](#) ()
Redraw the control "cleanly".
- virtual [GuiReturn_t](#) [ProcessEvent](#) ([GuiEvent_t](#) *pstEvent_)
Process an event sent to the control.
- virtual void [Activate](#) (bool bActivate_)
Activate or deactivate the current control - used when switching from one active control to another.

Additional Inherited Members

13.81.1 Detailed Description

Stub control class, used for testing out the GUI framework where certain controls have not yet been implemented.

Definition at line 796 of file [gui.h](#).

13.81.2 Member Function Documentation

13.81.2.1 `virtual void StubControl::Activate (bool bActivate_) [inline],[virtual]`

Activate or deactivate the current control - used when switching from one active control to another.

Parameters

<i>bActivate_</i>	- true to activate, false to deactivate
-------------------	-----------------------------------------

Implements [GuiControl](#).

Definition at line 802 of file [gui.h](#).

13.81.2.2 `virtual void StubControl::Draw () [inline],[virtual]`

Redraw the control "cleanly".

Subclass specific.

Implements [GuiControl](#).

Definition at line 800 of file [gui.h](#).

13.81.2.3 `virtual void StubControl::Init () [inline],[virtual]`

Initialiize the control - must be called before use.

Implementation is subclass specific.

Implements [GuiControl](#).

Definition at line 799 of file [gui.h](#).

13.81.2.4 `virtual GuiReturn_t StubControl::ProcessEvent (GuiEvent_t * pstEvent_) [inline],[virtual]`

Process an event sent to the control.

Subclass specific implementation.

Parameters

<i>pstEvent_</i>	Pointer to a struct containing the event data
------------------	-----------------------------------------------

Implements [GuiControl](#).

Definition at line 801 of file [gui.h](#).

The documentation for this class was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/gui.h](#)

13.82 SystemHeap Class Reference

The [SystemHeap](#) class implements a heap which is accessible from all components in the system.

```
#include <system_heap.h>
```

Static Public Member Functions

- static void [Init](#) (void)
Init Initialize the system heap prior to usage.
- static void * [Alloc](#) (K_USHORT usSize_)
Alloc allocate a block of data from the heap.
- static void [Free](#) (void *pvData_)
Free free a block of data previously allocated from the heap.

Static Private Attributes

- static K_UCHAR [m_pucRawHeap](#) [HEAP_RAW_SIZE]
Raw heap buffer.
- static [HeapConfig](#) [m_pclSystemHeapConfig](#) [HEAP_NUM_SIZES+1]
Heap configuration metadata.
- static [FixedHeap](#) [m_clSystemHeap](#)
Heap management object.
- static bool [m_bInit](#)
True if initialized, false if uninitialized.

13.82.1 Detailed Description

The [SystemHeap](#) class implements a heap which is accessible from all components in the system.

Definition at line 189 of file [system_heap.h](#).

13.82.2 Member Function Documentation

13.82.2.1 void * SystemHeap::Alloc (K_USHORT usSize_) [static]

Alloc allocate a block of data from the heap.

Parameters

<i>usSize_</i>	size of the block (in bytes) to allocate
----------------	------------------------------------------

Returns

pointer to a block of data allocated from the heap, or NULL on failure.

Definition at line 130 of file [system_heap.cpp](#).

13.82.2.2 void SystemHeap::Free (void * pvData_) [static]

Free free a block of data previously allocated from the heap.

Parameters

<code>pvData_</code>	Pointer to a block of data allocated from the system heap
----------------------	-----------------------------------------------------------

Definition at line 140 of file [system_heap.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/system_heap.h](#)
- [/home/moslevin/m3/embedded/stage/src/system_heap.cpp](#)

13.83 Thread Class Reference

Object providing fundamental multitasking support in the kernel.

```
#include <thread.h>
```

Inheritance diagram for Thread:

Public Member Functions

- void [Init](#) (K_UCHAR *paucStack_, K_USHORT usStackSize_, K_UCHAR ucPriority_, [ThreadEntry_t](#) pfEntry-Point_, void *pvArg_)
Initialize a thread prior to its use.
- void [Start](#) ()
Start the thread - remove it from the stopped list, add it to the scheduler's list of threads (at the thread's set priority), and continue along.
- void [Stop](#) ()
Stop a thread that's actively scheduled without destroying its stacks.
- void [SetName](#) (const K_CHAR *szName_)
Set the name of the thread - this is purely optional, but can be useful when identifying issues that come along when multiple threads are at play in a system.
- const K_CHAR * [GetName](#) ()
- [ThreadList](#) * [GetOwner](#) (void)
Return the [ThreadList](#) where the thread belongs when it's in the active/ready state in the scheduler.
- [ThreadList](#) * [GetCurrent](#) (void)
Return the [ThreadList](#) where the thread is currently located.
- K_UCHAR [GetPriority](#) (void)
Return the priority of the current thread.
- K_UCHAR [GetCurPriority](#) (void)
Return the priority of the current thread.
- void [SetQuantum](#) (K_USHORT usQuantum_)
Set the thread's round-robin execution quantum.
- K_USHORT [GetQuantum](#) (void)
Get the thread's round-robin execution quantum.
- void [SetCurrent](#) ([ThreadList](#) *pclNewList_)
Set the thread's current to the specified thread list.
- void [SetOwner](#) ([ThreadList](#) *pclNewList_)

- *Set the thread's owner to the specified thread list.*
- void [SetPriority](#) (K_UCHAR ucPriority_)
- *Set the priority of the [Thread](#) (running or otherwise) to a different level.*
- void [InheritPriority](#) (K_UCHAR ucPriority_)
- *Allow the thread to run at a different priority level (temporarily) for the purpose of avoiding priority inversions.*
- void [Exit](#) ()
- *Remove the thread from being scheduled again.*
- void [SetID](#) (K_UCHAR ucID_)
- *Set an 8-bit ID to uniquely identify this thread.*
- K_UCHAR [GetID](#) ()
- *Return the 8-bit ID corresponding to this thread.*
- K_USHORT [GetStackSlack](#) ()
- *Performs a (somewhat lengthy) check on the thread stack to check the amount of stack margin (or "slack") remaining on the stack.*

Static Public Member Functions

- static void [Sleep](#) (K_ULONG ulTimeMs_)
- *Put the thread to sleep for the specified time (in milliseconds).*
- static void [USleep](#) (K_ULONG ulTimeUs_)
- *Put the thread to sleep for the specified time (in microseconds).*
- static void [Yield](#) (void)
- *Yield the thread - this forces the system to call the scheduler and determine what thread should run next.*

Private Member Functions

- void [SetPriorityBase](#) (K_UCHAR ucPriority_)

Static Private Member Functions

- static void [ContextSwitchSWI](#) (void)
- *This code is used to trigger the context switch interrupt.*

Private Attributes

- K_UCHAR * [m_paucStackTop](#)
- *Pointer to the top of the thread's stack.*
- K_UCHAR * [m_paucStack](#)
- *Pointer to the thread's stack.*
- K_USHORT [m_usStackSize](#)
- *Size of the stack (in bytes)*
- K_USHORT [m_usQuantum](#)
- *[Thread](#) quantum (in milliseconds)*
- K_UCHAR [m_ucThreadID](#)
- *[Thread](#) ID.*
- K_UCHAR [m_ucPriority](#)
- *Default priority of the thread.*
- K_UCHAR [m_ucCurPriority](#)
- *Current priority of the thread (priority inheritance)*
- [ThreadEntry_t](#) [m_pfEntryPoint](#)

The entry-point function called when the thread starts.

- void * [m_pvArg](#)

Pointer to the argument passed into the thread's entrypoint.

- const K_CHAR * [m_szName](#)

Thread name.

- ThreadList * [m_pclCurrent](#)

Pointer to the thread-list where the thread currently resides.

- ThreadList * [m_pclOwner](#)

Pointer to the thread-list where the thread resides when active.

Friends

- class **ThreadPort**

Additional Inherited Members

13.83.1 Detailed Description

Object providing fundamental multitasking support in the kernel.

Definition at line 64 of file [thread.h](#).

13.83.2 Member Function Documentation

13.83.2.1 void Thread::ContextSwitchSWI (void) [static],[private]

This code is used to trigger the context switch interrupt.

Called whenever the kernel decides that it is necessary to swap out the current thread for the "next" thread.

Definition at line 331 of file [thread.cpp](#).

13.83.2.2 void Thread::Exit ()

Remove the thread from being scheduled again.

The thread is effectively destroyed when this occurs. This is extremely useful for cases where a thread encounters an unrecoverable error and needs to be restarted, or in the context of systems where threads need to be created and destroyed dynamically.

This must not be called on the idle thread.

Definition at line 149 of file [thread.cpp](#).

13.83.2.3 K_UCHAR Thread::GetCurPriority (void) [inline]

Return the priority of the current thread.

Returns

Priority of the current thread

Definition at line 167 of file [thread.h](#).

13.83.2.4 ThreadList * Thread::GetCurrent (void) [inline]

Return the [ThreadList](#) where the thread is currently located.

Returns

Pointer to the thread's current list

Definition at line 148 of file [thread.h](#).

13.83.2.5 K_UCHAR Thread::GetID () [inline]

Return the 8-bit ID corresponding to this thread.

Returns

[Thread](#)'s 8-bit ID, set by the user

Definition at line 295 of file [thread.h](#).

13.83.2.6 const K_CHAR * Thread::GetName () [inline]**Returns**

Pointer to the name of the thread. If this is not set, will be NULL.

Definition at line 128 of file [thread.h](#).

13.83.2.7 ThreadList * Thread::GetOwner (void) [inline]

Return the [ThreadList](#) where the thread belongs when it's in the active/ready state in the scheduler.

Returns

Pointer to the [Thread](#)'s owner list

Definition at line 139 of file [thread.h](#).

13.83.2.8 K_UCHAR Thread::GetPriority (void) [inline]

Return the priority of the current thread.

Returns

Priority of the current thread

Definition at line 158 of file [thread.h](#).

13.83.2.9 K_USHORT Thread::GetQuantum (void) [inline]

Get the thread's round-robin execution quantum.

Returns

The thread's quantum

Definition at line 186 of file [thread.h](#).

13.83.2.10 K_USHORT Thread::GetStackSlack ()

Performs a (somewhat lengthy) check on the thread stack to check the amount of stack margin (or "slack") remaining on the stack.

If you're having problems with blowing your stack, you can run this function at points in your code during development to see what operations cause problems. Also useful during development as a tool to optimally size thread stacks.

Returns

The amount of slack (unused bytes) on the stack

! ToDo: Take into account stacks that grow up

Definition at line 232 of file [thread.cpp](#).

13.83.2.11 void Thread::InheritPriority (K_UCHAR ucPriority_)

Allow the thread to run at a different priority level (temporarily) for the purpose of avoiding priority inversions.

This should only be called from within the implementation of blocking-objects.

Parameters

<i>ucPriority_</i>	New Priority to boost to.
--------------------	---------------------------

Definition at line 324 of file [thread.cpp](#).

13.83.2.12 void Thread::Init (K_UCHAR * paucStack_, K_USHORT usStackSize_, K_UCHAR ucPriority_, ThreadEntry_t pfEntryPoint_, void * pvArg_)

Initialize a thread prior to its use.

Initialized threads are placed in the stopped state, and are not scheduled until the thread's start method has been invoked first.

Parameters

<i>paucStack_</i>	Pointer to the stack to use for the thread
<i>usStackSize_</i>	Size of the stack (in bytes)
<i>ucPriority_</i>	Priority of the thread (0 = idle, 7 = max)
<i>pfEntryPoint_</i>	This is the function that gets called when the thread is started
<i>pvArg_</i>	Pointer to the argument passed into the thread's entrypoint function.

< Default round-robin thread quantum of 4ms

Definition at line 41 of file [thread.cpp](#).

13.83.2.13 void Thread::SetCurrent (ThreadList * pclNewList_) [inline]

Set the thread's current to the specified thread list.

Parameters

<i>pclNewList_</i>	Pointer to the threadlist to apply thread ownership
--------------------	-----------------------------------------------------

Definition at line 196 of file [thread.h](#).

13.83.2.14 void Thread::SetID (K_UCHAR *ucID_*) [inline]

Set an 8-bit ID to uniquely identify this thread.

Parameters

<i>ucID_</i>	8-bit Thread ID, set by the user
--------------	--------------------------------------------------

Definition at line 286 of file [thread.h](#).

13.83.2.15 void Thread::SetName (const K_CHAR * *szName_*) [inline]

Set the name of the thread - this is purely optional, but can be useful when identifying issues that come along when multiple threads are at play in a system.

Parameters

<i>szName_</i>	Char string containing the thread name
----------------	----------------------------------------

Definition at line 120 of file [thread.h](#).

13.83.2.16 void Thread::SetOwner (ThreadList * *pclNewList_*) [inline]

Set the thread's owner to the specified thread list.

Parameters

<i>pclNewList_</i>	Pointer to the threadlist to apply thread ownership
--------------------	-----------------------------------------------------

Definition at line 205 of file [thread.h](#).

13.83.2.17 void Thread::SetPriority (K_UCHAR *ucPriority_*)

Set the priority of the [Thread](#) (running or otherwise) to a different level.

This activity involves re-scheduling, and must be done so with due caution, as it may effect the determinism of the system.

This should *always* be called from within a critical section to prevent system issues.

Parameters

<i>ucPriority_</i>	New priority of the thread
--------------------	----------------------------

Definition at line 287 of file [thread.cpp](#).

13.83.2.18 void Thread::SetPriorityBase (K_UCHAR *ucPriority_*) [private]

Parameters

<i>ucPriority_</i>	
--------------------	--

Definition at line 277 of file [thread.cpp](#).

13.83.2.19 void Thread::SetQuantum (K_USHORT *usQuantum_*) [inline]

Set the thread's round-robin execution quantum.

Parameters

<i>usQuantum_</i>	Thread 's execution quantum (in milliseconds)
-------------------	---------------------------------------------------------------

Definition at line 177 of file [thread.h](#).

13.83.2.20 void Thread::Sleep (K_ULONG *ulTimeMs_*) [static]

Put the thread to sleep for the specified time (in milliseconds).

Actual time slept may be longer (but not less than) the interval specified.

Parameters

<i>ulTimeMs_</i>	Time to sleep (in ms)
------------------	-----------------------

Definition at line 188 of file [thread.cpp](#).

13.83.2.21 void Thread::Stop (void)

Stop a thread that's actively scheduled without destroying its stacks.

Stopped threads can be restarted using the [Start\(\)](#) API.

Definition at line 121 of file [thread.cpp](#).

13.83.2.22 void Thread::USleep (K_ULONG *ulTimeUs_*) [static]

Put the thread to sleep for the specified time (in microseconds).

Actual time slept may be longer (but not less than) the interval specified.

Parameters

<i>ulTimeUs_</i>	Time to sleep (in microseconds)
------------------	---------------------------------

Definition at line 210 of file [thread.cpp](#).

13.83.2.23 void Thread::Yield (void) [static]

Yield the thread - this forces the system to call the scheduler and determine what thread should run next.

This is typically used when threads are moved in and out of the scheduler.

Definition at line 253 of file [thread.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/thread.h](#)
- [/home/moslevin/m3/embedded/stage/src/thread.cpp](#)

13.84 ThreadList Class Reference

This class is used for building thread-management facilities, such as schedulers, and blocking objects.

```
#include <threadlist.h>
```

Inheritance diagram for ThreadList:

Public Member Functions

- [ThreadList](#) ()
Default constructor - zero-initializes the data.
- void [SetPriority](#) (K_UCHAR ucPriority_)
Set the priority of this threadlist (if used for a scheduler).
- void [SetFlagPointer](#) (K_UCHAR *pucFlag_)
Set the pointer to a bitmap to use for this threadlist.
- void [Add](#) (LinkListNode *node_)
Add a thread to the threadlist.
- void [Add](#) (LinkListNode *node_, K_UCHAR *pucFlag_, K_UCHAR ucPriority_)
Add a thread to the threadlist, specifying the flag and priority at the same time.
- void [Remove](#) (LinkListNode *node_)
Remove the specified thread from the threadlist.
- [Thread](#) * [HighestWaiter](#) ()
Return a pointer to the highest-priority thread in the thread-list.

Private Attributes

- K_UCHAR [m_ucPriority](#)
Priority of the threadlist.
- K_UCHAR * [m_pucFlag](#)
Pointer to the bitmap/flag to set when used for scheduling.

Additional Inherited Members

13.84.1 Detailed Description

This class is used for building thread-management facilities, such as schedulers, and blocking objects.

Definition at line 34 of file [threadlist.h](#).

13.84.2 Member Function Documentation

13.84.2.1 void ThreadList::Add (LinkListNode * node_) [virtual]

Add a thread to the threadlist.

Parameters

<i>node_</i>	Pointer to the thread (link list node) to add to the list
--------------	-----------------------------------------------------------

Reimplemented from [CircularLinkList](#).

Definition at line 46 of file [threadlist.cpp](#).

13.84.2.2 void ThreadList::Add (LinkListNode * *node_*, K_UCHAR * *pucFlag_*, K_UCHAR *ucPriority_*)

Add a thread to the threadlist, specifying the flag and priority at the same time.

Parameters

<i>node_</i>	Pointer to the thread to add (link list node)
<i>pucFlag_</i>	Pointer to the bitmap flag to set (if used in a scheduler context), or NULL for non-scheduler.
<i>ucPriority_</i>	Priority of the threadlist

Definition at line 62 of file [threadlist.cpp](#).

13.84.2.3 Thread * ThreadList::HighestWaiter ()

Return a pointer to the highest-priority thread in the thread-list.

Returns

Pointer to the highest-priority thread

Definition at line 87 of file [threadlist.cpp](#).

13.84.2.4 void ThreadList::Remove (LinkListNode * *node_*) [virtual]

Remove the specified thread from the threadlist.

Parameters

<i>node_</i>	Pointer to the thread to remove
--------------	---------------------------------

Reimplemented from [CircularLinkList](#).

Definition at line 71 of file [threadlist.cpp](#).

13.84.2.5 void ThreadList::SetFlagPointer (K_UCHAR * *pucFlag_*)

Set the pointer to a bitmap to use for this threadlist.

Once again, only needed when the threadlist is being used for scheduling purposes.

Parameters

<i>pucFlag_</i>	Pointer to the bitmap flag
-----------------	----------------------------

Definition at line 40 of file [threadlist.cpp](#).

13.84.2.6 void ThreadList::SetPriority (K_UCHAR *ucPriority_*)

Set the priority of this threadlist (if used for a scheduler).

Parameters

<i>ucPriority_</i>	Priority level of the thread list
--------------------	-----------------------------------

Definition at line 34 of file [threadlist.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/threadlist.h](#)
- [/home/moslevin/m3/embedded/stage/src/threadlist.cpp](#)

13.85 ThreadPort Class Reference

Class defining the architecture specific functions required by the kernel.

```
#include <threadport.h>
```

Static Public Member Functions

- static void [StartThreads](#) ()
Function to start the scheduler, initial threads, etc.

Static Private Member Functions

- static void [InitStack](#) ([Thread](#) *pstThread_)
Initialize the thread's stack.

Friends

- class [Thread](#)

13.85.1 Detailed Description

Class defining the architecture specific functions required by the kernel.

This is limited (at this point) to a function to start the scheduler, and a function to initialize the default stack-frame for a thread.

Definition at line 167 of file [threadport.h](#).

13.85.2 Member Function Documentation

13.85.2.1 void [ThreadPort::InitStack](#) ([Thread](#) * *pstThread_*) [static], [private]

Initialize the thread's stack.

Parameters

<i>pstThread_</i>	Pointer to the thread to initialize
-------------------	-------------------------------------

Definition at line 37 of file [threadport.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/threadport.h](#)
- [/home/moslevin/m3/embedded/stage/src/threadport.cpp](#)

13.86 Timer Class Reference

Timer - an event-driven execution context based on a specified time interval.

```
#include <timerlist.h>
```

Inheritance diagram for Timer:

Public Member Functions

- **Timer** ()
Default Constructor - zero-initializes all internal data.
- void **Start** (K_UCHAR bRepeat_, K_ULONG ulIntervalMs_, TimerCallback_t pfCallback_, void *pvData_)
Start a timer using default ownership, using repeats as an option, and millisecond resolution.
- void **Stop** ()
Stop a timer already in progress.
- void **SetFlags** (K_UCHAR ucFlags_)
Set the timer's flags based on the bits in the ucFlags_ argument.
- void **SetCallback** (TimerCallback_t pfCallback_)
Define the callback function to be executed on expiry of the timer.
- void **SetData** (void *pvData_)
Define a pointer to be sent to the timer callback on timer expiry.
- void **SetOwner** (Thread *pclOwner_)
Set the owner-thread of this timer object (all timers must be owned by a thread).
- void **SetIntervalTicks** (K_ULONG ulTicks_)
Set the timer expiry in system-ticks (platform specific!)
- void **SetIntervalSeconds** (K_ULONG ulSeconds_)
! The next three cost us 330 bytes of flash on AVR...
- void **SetIntervalMSeconds** (K_ULONG ulMSeconds_)
Set the timer expiry interval in milliseconds (platform agnostic)
- void **SetIntervalUSeconds** (K_ULONG ulUSeconds_)
Set the timer expiry interval in microseconds (platform agnostic)

Private Attributes

- K_UCHAR **m_ucFlags**
Flags for the timer, defining if the timer is one-shot or repeated.
- TimerCallback_t **m_pfCallback**
Pointer to the callback function.
- K_ULONG **m_ulInterval**
Interval of the timer in timer ticks.
- K_ULONG **m_ulTimeLeft**
Time remaining on the timer.
- Thread * **m_pclOwner**
Pointer to the owner thread.
- void * **m_pvData**
Pointer to the callback data.

Friends

- class **TimerList**

Additional Inherited Members

13.86.1 Detailed Description

Timer - an event-driven execution context based on a specified time interval.

This inherits from a [LinkedListNode](#) for ease of management by a global [TimerList](#) object.

Definition at line 78 of file [timerlist.h](#).

13.86.2 Member Function Documentation

13.86.2.1 void **Timer::SetCallback** ([TimerCallback_t](#) *pfCallback_*) [inline]

Define the callback function to be executed on expiry of the timer.

Parameters

<i>pfCallback_</i>	Pointer to the callback function to call
--------------------	------------------------------------------

Definition at line 116 of file [timerlist.h](#).

13.86.2.2 void **Timer::SetData** (void * *pvData_*) [inline]

Define a pointer to be sent to the timer callbacak on timer expiry.

Parameters

<i>pvData_</i>	Pointer to data to pass as argument into the callback
----------------	-------------------------------------------------------

Definition at line 125 of file [timerlist.h](#).

13.86.2.3 void **Timer::SetFlags** ([K_UCHAR](#) *ucFlags_*) [inline]

Set the timer's flags based on the bits in the *ucFlags_* argument.

Parameters

<i>ucFlags_</i>	Flags to assign to the timer object. TIMERLIST_FLAG_ONE_SHOT for a one-shot timer, 0 for a continuous timer.
-----------------	------------------------------------------------------------------------------------------------------------------------------

Definition at line 107 of file [timerlist.h](#).

13.86.2.4 void **Timer::SetIntervalMSeconds** ([K_ULONG](#) *uIMSeconds_*)

Set the timer expiry interval in milliseconds (platform agnostic)

Parameters

<i>uIMSeconds_</i>	Time in milliseconds
--------------------	----------------------

Definition at line 273 of file [timerlist.cpp](#).

13.86.2.5 void Timer::SetIntervalSeconds (K_ULONG *ulSeconds_*)

! The next three cost us 330 bytes of flash on AVR...

Set the timer expiry interval in seconds (platform agnostic)

Parameters

<i>ulSeconds_</i>	Time in seconds
-------------------	-----------------

Definition at line 267 of file [timerlist.cpp](#).

13.86.2.6 void Timer::SetIntervalTicks (K_ULONG *ulTicks_*)

Set the timer expiry in system-ticks (platform specific!)

Parameters

<i>ulTicks_</i>	Time in ticks
-----------------	---------------

Definition at line 259 of file [timerlist.cpp](#).

13.86.2.7 void Timer::SetIntervalUSecs (K_ULONG *ulUSecs_*)

Set the timer expiry interval in microseconds (platform agnostic)

Parameters

<i>ulUSecs_</i>	Time in microseconds
-----------------	----------------------

Definition at line 279 of file [timerlist.cpp](#).

13.86.2.8 void Timer::SetOwner (Thread * *pclOwner_*) [inline]

Set the owner-thread of this timer object (all timers must be owned by a thread).

Parameters

<i>pclOwner_</i>	Owner thread of this timer object
------------------	-----------------------------------

Definition at line 135 of file [timerlist.h](#).

13.86.2.9 void Timer::Stop (void)

Stop a timer already in progress.

Has no effect on timers that have already been stopped.

Definition at line 253 of file [timerlist.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/timerlist.h](#)
- [/home/moslevin/m3/embedded/stage/src/timerlist.cpp](#)

13.87 TimerEvent_t Struct Reference

Timer UI event structure.

```
#include <gui.h>
```

Public Attributes

- K_USHORT [usTicks](#)
Number of clock ticks (arbitrary) that have elapsed.

13.87.1 Detailed Description

Timer UI event structure.

Definition at line 177 of file [gui.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/gui.h](#)

13.88 TimerList Class Reference

TimerList class - a doubly-linked-list of timer objects.

```
#include <timerlist.h>
```

Inheritance diagram for TimerList:

Public Member Functions

- void [Init](#) ()
Initialize the [TimerList](#) object.
- void [Add](#) ([Timer](#) *pclListNode_)
Add a timer to the [TimerList](#).
- void [Remove](#) ([Timer](#) *pclListNode_)
Remove a timer from the [TimerList](#), cancelling its expiry.
- void [Process](#) ()
Process all timers in the timerlist as a result of the timer expiring.

Private Attributes

- K_ULONG [m_ulNextWakeup](#)
The time (in system clock ticks) of the next wakeup event.
- K_UCHAR [m_bTimerActive](#)
Whether or not the timer is active.

Additional Inherited Members

13.88.1 Detailed Description

[TimerList](#) class - a doubly-linked-list of timer objects.

Definition at line 200 of file [timerlist.h](#).

13.88.2 Member Function Documentation

13.88.2.1 void TimerList::Add (Timer * *pcListNode_*)

Add a timer to the [TimerList](#).

Parameters

<i>pcListNode_</i>	Pointer to the Timer to Add
--------------------	---------------------------------------------

Definition at line 58 of file [timerlist.cpp](#).

13.88.2.2 void TimerList::Init (void)

Initialize the [TimerList](#) object.

Must be called before using the object.

Definition at line 51 of file [timerlist.cpp](#).

13.88.2.3 void TimerList::Process (void)

Process all timers in the timerlist as a result of the timer expiring.

This will select a new timer epoch based on the next timer to expire. ToDo - figure out if we need to deal with any overtime here.

Definition at line 113 of file [timerlist.cpp](#).

13.88.2.4 void TimerList::Remove (Timer * *pcListNode_*)

Remove a timer from the [TimerList](#), cancelling its expiry.

Parameters

<i>pcListNode_</i>	Pointer to the Timer to remove
--------------------	------------------------------------------------

Definition at line 98 of file [timerlist.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/timerlist.h](#)
- [/home/moslevin/m3/embedded/stage/src/timerlist.cpp](#)

13.89 TimerScheduler Class Reference

"Static" Class used to interface a global [TimerList](#) with the rest of the kernel.

```
#include <timerlist.h>
```

Static Public Member Functions

- static void [Init](#) ()
Initialize the timer scheduler.
- static void [Add](#) ([Timer](#) *pclListNode_)
Add a timer to the timer scheduler.
- static void [Remove](#) ([Timer](#) *pclListNode_)
Remove a timer from the timer scheduler.
- static void [Process](#) ()
This function must be called on timer expiry (from the timer's ISR context).

Static Private Attributes

- static [TimerList](#) [m_clTimerList](#)
[TimerList](#) object manipulated by the [Timer Scheduler](#).

13.89.1 Detailed Description

"Static" Class used to interface a global [TimerList](#) with the rest of the kernel.

Definition at line 250 of file [timerlist.h](#).

13.89.2 Member Function Documentation

13.89.2.1 void [TimerScheduler::Add](#) ([Timer](#) * [pclListNode_](#)) [\[inline\]](#), [\[static\]](#)

Add a timer to the timer scheduler.

Adding a timer implicitly starts the timer as well.

Parameters

pclListNode_	Pointer to the timer list node to add
------------------------------	---------------------------------------

Definition at line 269 of file [timerlist.h](#).

13.89.2.2 void [TimerScheduler::Init](#) (void) [\[inline\]](#), [\[static\]](#)

Initialize the timer scheduler.

Must be called before any timer, or timer-derived functions are used.

Definition at line 259 of file [timerlist.h](#).

13.89.2.3 void [TimerScheduler::Process](#) (void) [\[inline\]](#), [\[static\]](#)

This function must be called on timer expiry (from the timer's ISR context).

This will result in all timers being updated based on the epoch that just elapsed. New timer epochs are set based on the next timer to expire.

Definition at line 291 of file [timerlist.h](#).

13.89.2.4 void TimerScheduler::Remove (Timer * *pcListNode_*) [inline],[static]

Remove a timer from the timer scheduler.

May implicitly stop the timer if this is the only active timer scheduled.

Parameters

<i>pcListNode_</i>	Pointer to the timer list node to remove
--------------------	------------------------------------------

Definition at line 280 of file [timerlist.h](#).

The documentation for this class was generated from the following files:

13.90 Token_t Struct Reference

Token descriptor struct format.

```
#include <memutil.h>
```

Public Attributes

- const K_CHAR * [pcToken](#)
Pointer to the beginning of the token string.
- K_UCHAR [ucLen](#)
Length of the token (in bytes)

13.90.1 Detailed Description

Token descriptor struct format.

Definition at line 32 of file [memutil.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/memutil.h](#)

13.91 TouchEvent_t Struct Reference

Touch UI event structure.

```
#include <gui.h>
```

Public Attributes

- K_USHORT [usX](#)
Absolute touch location (pixels)
- K_USHORT [usY](#)
Absolute touch location (pixels)

```

• union {
    K_USHORT ucFlags
        Modifier flags.
    struct {
        unsigned int bTouch:1
            Whether or not touch is up or down.
    }
};

```

13.91.1 Detailed Description

Touch UI event structure.

Definition at line 125 of file [gui.h](#).

The documentation for this struct was generated from the following file:

- [/home/moslevin/m3/embedded/stage/src/gui.h](#)

13.92 UnitTest Class Reference

Class used to implement a simple unit-testing framework.

```
#include <unit_test.h>
```

Public Member Functions

- void [SetName](#) (const K_CHAR *szName_)

Set the name of the test object.
- void [Start](#) ()

Start a new test iteration.
- void [Pass](#) ()

Stop the current iteration (if started), and register that the test was successful.
- void [Fail](#) ()

Stop the current iterations (if started), and register that the current test failed.
- void [ExpectTrue](#) (bool bExpression_)
- void [ExpectFalse](#) (bool bExpression_)
- void [ExpectEquals](#) (bool bVal_, bool bExpression_)
- void [ExpectEquals](#) (K_UCHAR ucVal_, K_UCHAR ucExpression_)
- void [ExpectEquals](#) (K_USHORT usVal_, K_USHORT usExpression_)
- void [ExpectEquals](#) (K_ULONG ulVal_, K_ULONG ulExpression_)
- void [ExpectEquals](#) (K_CHAR cVal_, K_CHAR cExpression_)
- void [ExpectEquals](#) (K_SHORT sVal_, K_SHORT sExpression_)
- void [ExpectEquals](#) (K_LONG lVal_, K_LONG lExpression_)
- void [ExpectEquals](#) (void *pvVal_, void *pvExpression_)
- void [ExpectFailTrue](#) (bool bExpression_)
- void [ExpectFailFalse](#) (bool bExpression_)
- void [ExpectFailEquals](#) (bool bVal_, bool bExpression_)
- void [ExpectFailEquals](#) (K_UCHAR ucVal_, K_UCHAR ucExpression_)
- void [ExpectFailEquals](#) (K_USHORT usVal_, K_USHORT usExpression_)
- void [ExpectFailEquals](#) (K_ULONG ulVal_, K_ULONG ulExpression_)
- void [ExpectFailEquals](#) (K_CHAR cVal_, K_CHAR cExpression_)
- void [ExpectFailEquals](#) (K_SHORT sVal_, K_SHORT sExpression_)

- void **ExpectFailEquals** (K_LONG IVal_, K_LONG IExpression_)
- void **ExpectFailEquals** (void *pvVal_, void *pvExpression_)
- void **ExpectGreaterThan** (K_LONG IVal_, K_LONG IExpression_)
- void **ExpectLessThan** (K_LONG IVal_, K_LONG IExpression_)
- void **ExpectGreaterThanEquals** (K_LONG IVal_, K_LONG IExpression_)
- void **ExpectLessThanEquals** (K_LONG IVal_, K_LONG IExpression_)
- void **ExpectFailGreaterThan** (K_LONG IVal_, K_LONG IExpression_)
- void **ExpectFailLessThan** (K_LONG IVal_, K_LONG IExpression_)
- void **ExpectFailGreaterThanEquals** (K_LONG IVal_, K_LONG IExpression_)
- void **ExpectFailLessThanEquals** (K_LONG IVal_, K_LONG IExpression_)
- void **Complete** ()
Complete the test.
- const K_CHAR * **GetName** ()
Get the name of the tests associated with this object.
- K_BOOL **GetResult** ()
Return the result of the last test.
- K_USHORT **GetPassed** ()
Return the total number of test points/iterations passed.
- K_USHORT **GetFailed** ()
Return the number of failed test points/iterations.
- K_USHORT **GetTotal** ()
Return the total number of iterations/test-points executed.

Private Attributes

- const K_CHAR * **m_szName**
Name of the tests performed.
- K_BOOL **m_blsActive**
Whether or not the test is active.
- K_UCHAR **m_bComplete**
Whether or not the test is complete.
- K_BOOL **m_bStatus**
Status of the last-run test.
- K_USHORT **m_usIterations**
Number of iterations executed.
- K_USHORT **m_usPassed**
Number of iterations that have passed.

13.92.1 Detailed Description

Class used to implement a simple unit-testing framework.

Definition at line 28 of file [unit_test.h](#).

13.92.2 Member Function Documentation

13.92.2.1 void UnitTest::Complete () [inline]

Complete the test.

Once a test has been completed, no new iterations can be started (i.e [Start\(\)](#)/[Pass\(\)](#)/[Fail\(\)](#) will have no effect).

Definition at line 157 of file [unit_test.h](#).

13.92.2.2 K_USHORT UnitTest::GetFailed () [inline]

Return the number of failed test points/iterations.

Returns

Failed test point/iteration count

Definition at line 193 of file [unit_test.h](#).

13.92.2.3 const K_CHAR * UnitTest::GetName () [inline]

Get the name of the tests associated with this object.

Returns

Name of the test

Definition at line 166 of file [unit_test.h](#).

13.92.2.4 K_USHORT UnitTest::GetPassed () [inline]

Return the total number of test points/iterations passed.

Returns

Count of all successful test points/iterations

Definition at line 184 of file [unit_test.h](#).

13.92.2.5 K_BOOL UnitTest::GetResult () [inline]

Return the result of the last test.

Returns

Status of the last run test (false = fail, true = pass)

Definition at line 175 of file [unit_test.h](#).

13.92.2.6 K_USHORT UnitTest::GetTotal () [inline]

Return the total number of iterations/test-points executed.

Returns

Total number of iterations/test-points executed

Definition at line 202 of file [unit_test.h](#).

13.92.2.7 void UnitTest::SetName (const K_CHAR * szName_) [inline]

Set the name of the test object.

Parameters

<code>szName_</code>	Name of the tests associated with this object
----------------------	-----------------------------------------------

Definition at line 41 of file [unit_test.h](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/unit_test.h](#)

13.93 WriteBuffer16 Class Reference

This class is used to provide a general-purpose, fully thread-safe circular buffer implementation which can be used for creating tracebuffers, data logging queues, transaction queues, etc.

```
#include <writebuf16.h>
```

Public Member Functions

- void [SetBuffers](#) (K_USHORT *pusData_, K_USHORT usSize_)
Assign the data to be used as storage for this circular buffer.
- void [SetCallback](#) ([WriteBufferCallback](#) pfCallback_)
Set the callback function to be called when the buffer hits 50% of its capacity, and again when the buffer rolls over completely.
- void [WriteData](#) (K_USHORT *pusBuf_, K_USHORT usLen_)
Write an array of values to the circular buffer.
- void [WriteVector](#) (K_USHORT **ppusBuf_, K_USHORT *pusLen_, K_UCHAR ucCount_)
Write a multi-part vector to the circular buffer.

Private Attributes

- K_USHORT * [m_pusData](#)
Pointer to the circular buffer data.
- volatile K_USHORT [m_usSize](#)
Size of the buffer.
- volatile K_USHORT [m_usHead](#)
Current head element (where data is written)
- volatile K_USHORT [m_usTail](#)
Current tail element (where data is read)
- [WriteBufferCallback](#) [m_pfCallback](#)
Buffer callback function.

13.93.1 Detailed Description

This class is used to provide a general-purpose, fully thread-safe circular buffer implementation which can be used for creating tracebuffers, data logging queues, transaction queues, etc.

We use it for implementing a debug print journal.

Definition at line 37 of file [writebuf16.h](#).

13.93.2 Member Function Documentation

13.93.2.1 `void WriteBuffer16::SetBuffers (K_USHORT * pusData_, K_USHORT usSize_)` `[inline]`

Assign the data to be used as storage for this circular buffer.

Parameters

<i>pusData_</i>	Pointer to the array of data to be managed as a circular buffer by this object.
<i>usSize_</i>	Size of the buffer in 16-bit elements

Definition at line 50 of file [writebuf16.h](#).

13.93.2.2 `void WriteBuffer16::SetCallback (WriteBufferCallback pfCallback_)` `[inline]`

Set the callback function to be called when the buffer hits 50% of its capacity, and again when the buffer rolls over completely.

Parameters

<i>pfCallback_</i>	Function pointer to call whenever the buffer has reached 50% capacity, or has rolled over completely.
--------------------	-------------------------------------------------------------------------------------------------------

Definition at line 69 of file [writebuf16.h](#).

13.93.2.3 `void WriteBuffer16::WriteData (K_USHORT * pusBuf_, K_USHORT usLen_)`

Write an array of values to the circular buffer.

Parameters

<i>pusBuf_</i>	Source data array to write to the circular buffer
<i>usLen_</i>	Length of the source data array in 16-bit elements

Definition at line 25 of file [writebuf16.cpp](#).

13.93.2.4 `void WriteBuffer16::WriteVector (K_USHORT ** ppusBuf_, K_USHORT * pusLen_, K_UCHAR ucCount_)`

Write a multi-part vector to the circular buffer.

Parameters

<i>ppusBuf_</i>	Pointer to the array of source data pointers
<i>pusLen_</i>	Array of buffer lengths
<i>ucCount_</i>	Number of source-data arrays to write to the buffer

Definition at line 37 of file [writebuf16.cpp](#).

The documentation for this class was generated from the following files:

- [/home/moslevin/m3/embedded/stage/src/writebuf16.h](#)
- [/home/moslevin/m3/embedded/stage/src/writebuf16.cpp](#)

Classes

- class [BlockingObject](#)
Class implementing thread-blocking primitives.

14.3.1 Detailed Description

Blocking object base class declarations. A Blocking object in Mark3 is essentially a thread list. Any blocking object implementation (being a semaphore, mutex, event flag, etc.) can be built on top of this class, utilizing the provided functions to manipulate thread location within the [Kernel](#).

Blocking a thread results in that thread becoming de-scheduled, placed in the blocking object's own private list of threads which are waiting on the object.

Unblocking a thread results in the reverse: The thread is moved back to its original location from the blocking list.

The only difference between a blocking object based on this class is the logic used to determine what constitutes a Block or Unblock condition.

For instance, a semaphore Pend operation may result in a call to the Block() method with the currently-executing

Portable DCPU-16 CPU emulator.

```
#include "dcpu.h"
#include "kerneltypes.h"
#include "ll.h"
```

Macros

- `#define CORE_DEBUG 0`
- `#define DBG_PRINT(...)`

Variables

- static const K_UCHAR `aucBasicOpcodeCycles []`
Define the number of cycles that each "basic" opcode takes to execute.
- static const K_UCHAR `aucExtendedOpcodeCycles []`
Define the number of cycles that each "extended" opcode takes to execute.

14.41.1 Detailed Description

Portable DCPU-16 CPU emulator. The DCPU-16 is the in-game CPU used in the upcoming game 0x10^c, from the creators of the wildly successful Minecraft. While the [DCPU](#) is supposed to be part of the game, it has serious potential for use in all sorts of embedded applications.

The fact that [DCPU](#) is a very lightweight VM to implement and contains built-in instructions for accessing hardware peripherals and handling external interrupts lends itself to being used on microcontrollers.

Unlike a lot of embedded CPUs, DCPU-16 assembly is extremely simple to learn, since it has a very limited number of opcodes (37), each of which provide the same register/memory addressing modes for all operands. There are also only 2 opcode formats which make interpreting opcodes very efficient.

The DCPU-16 is extended using a variable number of "external hardware devices" which communicate with the CPU core using interrupts. These devices are enumerated on startup, and since there is no defined format for how these devices work, we can hijack this interface to provide a way for the [DCPU](#) to access resources supplied by the OS (i.e Timers, Drivers), or the hardware directly. This also lends itself to inter-VM communications (multiple DCPUs communicating with eachother in different OS threads). There's an immense amount of flexibility here - applications from debugging to scripting to runtime-configuration are all easily supported by this machine.

But what is a platform without tools support? Fortunately, the hype around 0x10c is building - and a development community for this platform has grown immensely. There are a number of compilers, assemblers, and IDEs, many of which support virtualized hardware extensions. One of the compilers is a CLANG/LLVM backend, which should allow for very good C language support.

I had attempted to do something similar by creating a VM based on the 8051 (see the Funk51 project on sourceforge), but that project was at least four times as large - and the tools support was very spotty. There were C compilers, but there was a lot of shimming required to produce output that was suitable for the VM. Also, the lack of a native host interface (interrupts, hardware bus enumerations, etc.) forced a non-standard approach to triggering native methods by writing commands to a reserved chunk of memory and writing to a special "trigger" address to invoke the native system. Using a DCPU-16 based simulator addresses this in a nice, clean way by providing modern tools, and a VM infrastructure tailored to be interfaced with a host.

Regarding this version of the [DCPU](#) emulator - it's very simple to use. Program binaries are loaded into buffers in the host CPU's RAM, with the host also providing a separate buffer for [DCPU](#) RAM. The size of the [DCPU](#) RAM buffer will contain both the RAM area, as well as the program stack, so care must be taken to ensure that the stack doesn't overflow. The [DCPU](#) specification allows for 64K words (128KB) of RAM and ROM each, but this implementation allows us to tailor the CPU for more efficient or minimal environments.

In the future, this emulator will be extended to provide a mechanism to allow programs to be run out of flash, EEPROM, or other interfaces via the Mark3 Drivers API.

Once the program has been loaded into the host's address space, the [DCPU](#) class can be initialized.

```
// Use 16-bit words for 16-bit emulator.
K_USHORT ausRAM[ RAM_SIZE ];
K_USHORT ausROM[ ROM_SIZE ];
{
    class DCPU c1MyDCPU;

    // Read program code into ausROM buffer here

    // Initialize the DCPU emulator
    c1MyDCPU.Init( ausROM, RAM_SIZE, ausROM, ROM_SIZE );
}

```

Once the emulator has been initialized, the VM can be run one opcode at a time, as in the following example.

```
while(1)
{
    c1MyCPU.RunOpcode();
}

```

To inspect the contents of the VM's registers, call the GetRegisters() method. This is useful for printing the CPU state on a regular basis, or using the PC value to determine when to end execution, or to provide an offset for disassembling the current opcode.

```
DCPU_Registers *pstRegisters;
pstRegisters = c1MyCPU.GetRegisters();

```

DCPU-16 emulator.

```

#include "kerneltypes.h"
#include "ll.h"

```

Classes

- struct [DCPU_Registers](#)
Structure defining the [DCPU](#) hardware registers.
- class [DCPUPugin](#)
Class used to provide the hardware device abstraction between the [DCPU-16](#) emulator/VM and the host system.
- class [DCPU](#)
[DCPU](#) emulator, used for running code out of EEPROM, RAM, or other memory interfaces than FLASH.

Macros

- #define [DCPU_NORMAL_OPCODE_MASK](#)(x) ((K_USHORT)(x & 0x001F))
[DCPU](#) v1.7 CPU emulator.
- #define [DCPU_EXTENDED_OPCODE_MASK](#)(x) ((K_USHORT)((x >> 5) & 0x001F))
- #define [DCPU_A_MASK](#)(x) ((K_USHORT)((x >> 10) & 0x003F))
- #define [DCPU_B_MASK](#)(x) ((K_USHORT)((x >> 5) & 0x001F))
- #define [DCPU_BUILD_NORMAL](#)(x, y, z) (((K_USHORT)(x) & 0x001F) | ((K_USHORT)(y) & 0x001F) << 5 | ((K_USHORT)(z) & 0x003F) << 10)
- #define [DCPU_BUILD_EXTENDED](#)(x, y) (((K_USHORT)(x & 0x001F) << 5) | ((K_USHORT)(y & 0x003F) << 10))

Typedefs

- typedef void(* [DCPU_Callback](#))(DCPU *pclVM_)
Callback function type used to implement HWI for VM->Host communications.

Enumerations

- enum [DCPU_OpBasic](#) {
[OP_NON_BASIC](#) = 0, [OP_SET](#), [OP_ADD](#), [OP_SUB](#),

14.43.1 Detailed Description

DCPU-16 emulator.

Definition in file [dcpu.h](#).

14.43.2 Macro Definition Documentation

14.43.2.1 **#define** [DCPU_NORMAL_OPCODE_MASK](#)(x) ((K_USHORT)(x & 0x001F))

[DCPU](#) v1.7 CPU emulator.

Basic opcode format: [aaaaaabbbbbooooo]

Where: - aaaaaa 6-bit source argument

- bbbbb 5-bit destination argument
- o is the opcode itself in a

If oooo = 0, then it's an "extended" opcode

Extended opcode format: [aaaaaaoooooxxxxx]

Where:

- xxxxx = all 0's - (basic opcode)
- ooooo = an extended opcode
- aaaaaa = the argument

Definition at line 48 of file [dcpu.h](#).

14.43.3 Enumeration Type Documentation

14.43.3.1 enum DCPU_OpBasic

[DCPU](#) Basic Opcodes.

Enumerator

OP_NON_BASIC special instruction - see below

OP_SET b, a | sets b to a

OP_ADD b, a | sets b to b+a, sets EX to 0x0001 if there's an overflow, 0x0 otherwise

OP_SUB b, a | sets b to b-a, sets EX to 0xffff if there's an underflow, 0x0 otherwise

OP_MUL b, a | sets b to b*a, sets EX to ((b*a)>>16)&0xffff (treats b, a as unsigned)

OP_MLI b, a | like MUL, but treat b, a as signed

OP_DIV b, a | sets b to b/a, sets EX to ((b<<16)/a)&0xffff. if a==0, sets b and EX to 0 instead. (treats b, a as unsigned)

OP_DVI b, a | like DIV, but treat b, a as signed. Rounds towards 0

OP_MOD b, a | sets b to ba. if a==0, sets b to 0 instead.

OP_MDI b, a | like MOD, but treat b, a as signed. (MDI -7, 16 == -7)

OP_AND b, a | sets b to b&a

OP_BOR b, a | sets b to b|a

OP_XOR b, a | sets b to b^a

OP_SHR b, a | sets b to b>>a, sets EX to ((b<<16)>>a)&0xffff (logical shift)

OP_ASR b, a | sets b to b>>a, sets EX to ((b<<16)>>a)&0xffff (arithmetic shift) (treats b as signed)

OP_SHL b, a | sets b to b<<a, sets EX to ((b<<a)>>16)&0xffff

OP_IFB b, a | performs next instruction only if (b&a)!=0

OP_IFC b, a | performs next instruction only if (b&a)==0

OP_IFE b, a | performs next instruction only if b==a

OP_IFN b, a | performs next instruction only if b!=a

OP_IFG b, a | performs next instruction only if b>a

OP_IFA b, a | performs next instruction only if b>a (signed)

OP_IFL b, a | performs next instruction only if b<a

OP_IFU b, a | performs next instruction only if b<a (signed)

OP_18 UNDEFINED

OP_19 UNDEFINED

OP_ADX b, a | sets b to b+a+EX, sets EX to 0x0001 if there is an over-flow, 0x0 otherwise

OP_SBX b, a | sets b to b-a+EX, sets EX to 0xFFFF if there is an under-flow, 0x0 otherwise

OP_1C UNDEFINED

OP_1D UNDEFINED

OP_STI b, a | sets b to a, then increases I and J by 1

OP_STD b, a | sets b to a, then decreases I and J by 1

Definition at line 99 of file [dcpu.h](#).

14.43.3.2 enum DCPU_OpExtended

DCPU Extended opcodes.

Enumerator

OP_EX_JSR a - pushes the address of the next instruction to the stack, then sets PC to a

OP_EX_2 UNDEFINED

OP_EX_3 UNDEFINED

OP_EX_4 UNDEFINED

OP_EX_5 UNDEFINED

OP_EX 6 UNDEFINED

OP_EX_7 UNDEFINED

OP_EX_INT Invoke software interrupt "a".

OP_EX_IAG Get interrupt address in "a".

OP_EX_IAS Set interrupt address from "a".

OP_EX_RFI Disables interrupt queueing, pops A from the stack, then pops PC from the stack.

OP_EX_IAQ if a is nonzero, interrupts will be added to the queue instead of triggered. if a is zero, interrupts will be triggered as normal again

OP EX D UNDEFINED

OP_EX_E UNDEFINED

OP_EX_F UNDEFINED

OP_EX_HWN Sets "a" to number of connected HW devices.

OP EX HWQ Set registers with information about hardware at index "a".

OP_EX_HWI Send an interrupt to hardware interface "a".

[Driver](#) abstraction framework.

```

#include "kerneltypes.h"
#include "mark3cfg.h"
#include "ll.h"

```

Classes

- class [Driver](#)
Base device-driver class used in hardware abstraction.
- class [DriverList](#)
List of [Driver](#) objects used to keep track of all device drivers in the system.

14.51.1 Detailed Description

[Driver](#) abstraction framework.

14.51.2 Intro

This is the basis of the driver framework. In the context of Mark3, drivers don't necessarily have to be based on physical hardware peripherals. They can be used to represent algorithms (such as random number generators), files, or protocol stacks. Unlike FunkOS, where driver IO is protected automatically by a mutex, we do not use this kind of protection - we leave it up to the driver implementor to do what's right in its own context. This also frees up the driver to implement all sorts of other neat stuff, like sending messages to threads associated with the driver.

Drivers are implemented as character devices, with the standard array of posix-style accessor methods for reading, writing, and general driver control.

A global driver list is provided as a convenient and minimal "filesystem" structure, in which devices can be accessed by name.

14.51.3 Driver Design

A device driver needs to be able to perform the following operations: -Initialize a peripheral -Start/stop a peripheral -Handle I/O control operations -Perform various read/write operations

At the end of the day, that's pretty much all a device driver has to do, and all of the functionality that needs to be presented to the developer.

We abstract all device drivers using a base-class which implements the following methods: -Start/Open -Stop/Close -Control -Read -Write

A basic driver framework and API can thus be implemented in five function calls - that's it! You could even reduce that further by handling the initialize, start, and stop operations inside the "control" operation.

14.51.4 Driver API

In C++, we can implement this as a class to abstract these event handlers, with virtual void functions in the base class overridden by the inherited objects.

To add and remove device drivers from the global table, we use the following methods:

```
void DriverList::Add( Driver *pclDriver_ );
void DriverList::Remove( Driver *pclDriver_ );
```

`DriverList::Add()/Remove()` takes a single arguments the pointer to the object to operate on.

Once a driver has been added to the table, drivers are opened by NAME using `DriverList::FindByName("/dev/name")`. This function returns a pointer to the specified driver if successful, or to a built in `/dev/null` device if the path name is invalid. After a driver is open, that pointer is used for all other driver access functions.

This abstraction is incredibly useful any peripheral or service can be accessed through a consistent set of APIs, that make it easy to substitute implementations from one platform to another. Portability is ensured, the overhead is negligible, and it emphasizes the reuse of both driver and application code as separate entities.

Consider a system with drivers for I2C, SPI, and UART peripherals - under our driver framework, an application can initialize these peripherals and write a greeting to each using the same simple API functions for all drivers:

```
pclI2C = DriverList::FindByName("/dev/i2c");
pclUART = DriverList::FindByName("/dev/tty0");
pclSPI = DriverList::FindByName("/dev/spi");

pclI2C->Write(12, "Hello World!");
pclUART->Write(12, "Hello World!");
pclSPI->Write(12, "Hello World!");
```

Fixed-block-size memory management.

```

#include "kerneltypes.h"
#include "fixed_heap.h"
#include "threadport.h"

```

14.53.1 Detailed Description

Fixed-block-size memory management. This allows a user to create heaps containing multiple lists, each list containing a linked-list of blocks that are each the same size. As a result of the linked-list format, these heaps are very fast - requiring only a linked list pop/push to allocated/free memory. Array traversal is required to allow for the optimal heap to be used. Blocks are chosen from the first heap with free blocks large enough to fulfill the request.

Only simple malloc/free functionality is supported in this implementation, no complex vector-allocate or reallocation functions are supported.

Heaps are protected by critical section, and are thus thread-safe.

When creating a heap, a user supplies an array of heap configuration objects, which determines how many objects of what size are available.

The configuration objects are defined from smallest list to largest, the memory to back the heap is supplied as a pointer to a "blob" of memory which will be used to create the underlying heap objects that make up the heap internal data structures. This blob must be large enough to contain all of the requested heap objects, with all of the additional metadata required to manage the objects.

Multiple heaps can be created using this library (heaps are not singleton).

Classes

- struct [KeyEvent_t](#)
Keyboard UI event structure definition.
- struct [MouseEvent_t](#)
Mouse UI event structure.
- struct [TouchEvent_t](#)
Touch UI event structure.
- struct [JoystickEvent_t](#)
Joystick UI event structure.
- struct [TimerEvent_t](#)
Timer UI event structure.
- struct [GuiEvent_t](#)
Composite UI event structure.
- class [GuiWindow](#)

- *Basic Window Class.*
- class [GuiEventSurface](#)
GUI Event Surface Object.
- class [GuiControl](#)
GUI Control Base Class.
- class [StubControl](#)
Stub control class, used for testing out the GUI framework where certain controls have not yet been implemented.

Macros

- #define [GUI_DEBUG](#) (0)
- #define [GUI_DEBUG_PRINT](#)(...)
- #define [EVENT_STATE_UP](#) (0)
Event state definitions, used for determining whether or not a button or key is in the "up" or "down" contact state.
- #define [EVENT_STATE_DOWN](#) (1)
- #define [MAX_WINDOW_CONTROLS](#) (251)
Maximum number of controls per window.
- #define [TARGET_ID_BROADCAST_Z](#) (252)
Broadcast event to all controls in the topmost window.
- #define [TARGET_ID_BROADCAST](#) (253)
Send event to all controls in all windows.
- #define [TARGET_ID_FOCUS](#) (254)
Send event to the in-focus control.
- #define [TARGET_ID_HIGH_Z](#) (255)
Send event to the highest Z-order control.

Enumerations

- enum [GuiEventType_t](#) {
[EVENT_TYPE_KEYBOARD](#), [EVENT_TYPE_MOUSE](#), [EVENT_TYPE_TOUCH](#), [EVENT_TYPE_JOYSTICK](#),
[EVENT_TYPE_TIMER](#), [EVENT_TYPE_COUNT](#) }
Enumeration defining the various UI event codes.
- enum [GuiReturn_t](#) {
[GUI_EVENT_OK](#) = 0, [GUI_EVENT_CONSUMED](#), [GUI_EVENT_CANCEL](#), [GUI_EVENT_RETRY](#),
[GUI_EVENT_COUNT](#) }

14.65.1 Detailed Description

Graphical User Interface classes and data structure declarations.

Definition in file [gui.h](#).

14.65.2 Enumeration Type Documentation

14.65.2.1 enum [GuiEventType_t](#)

Enumeration defining the various UI event codes.

Enumerator

- [EVENT_TYPE_KEYBOARD](#)** Keypress event.
- [EVENT_TYPE_MOUSE](#)** Mouse movement or click event.

```

00065 typedef enum

```

#include "kerneltypes.h"
#include "panic_codes.h"

```

Classes

- class [Kernel](#)

Class that encapsulates all of the kernel startup functions.

14.69.1 Detailed Description

Kernel initialization and startup class. The **Kernel** namespace provides functions related to initializing and starting up the kernel.

The **Kernel::Init()** function must be called before any of the other functions in the kernel can be used.

Once the initial kernel configuration has been completed (i.e. first threads have been added to the scheduler), the **Kernel::Start()** function can then be called, which will transition code execution from the "main()" context to the threads in the scheduler.

Definition in file [kernel.h](#).

14.70 kernel.h

00177     if (m_pstHead)
00178     {
00179         m_pstHead = m_pstHead->prev;
00180         m_pstTail = m_pstTail->prev;
00181     }
00182 }

```

14.95 /home/moslevin/m3/embedded/stage/src/ll.h File Reference

Core linked-list declarations, used by all kernel list types.

```
#include "kerneltypes.h"
```

Classes

- class [LinkedListNode](#)
Basic linked-list node data structure.
- class [LinkedList](#)
Abstract-data-type from which all other linked-lists are derived.
- class [DoubleLinkedList](#)
Doubly-linked-list data type, inherited from the base [LinkedList](#) type.
- class [CircularLinkedList](#)
Circular-linked-list data type, inherited from the base [LinkedList](#) type.

Macros

- `#define NULL (0)`
- `#define SAFE_UNLINK (1)`
"Safe unlinking" performs extra checks on data to make sure that there are no consistencies when performing node operations.

14.95.1 Detailed Description

Core linked-list declarations, used by all kernel list types. At the heart of RTOS data structures are linked lists. Having a robust and efficient set of linked-list types that we can use as a foundation for building the rest of our kernel types allows us to keep our RTOS code efficient and logically-separated.

So what data types rely on these linked-list classes?

-Threads -ThreadLists -The [Scheduler](#) -Timers, -The [Timer Scheduler](#) -Blocking objects (Semaphores, Mutexes, etc...)

Pretty much everything in the kernel uses these linked lists. By having objects inherit from the base linked-list node type, we're able to leverage the double and circular linked-list classes to manager virtually every object type in the system without duplicating code. These functions are very efficient as well, allowing for very deterministic behavior in our code.

Definition in file [ll.h](#).

14.95.2 Macro Definition Documentation

14.95.2.1 `#define SAFE_UNLINK (1)`

"Safe unlinking" performs extra checks on data to make sure that there are no consistencies when performing node operations.

This goes beyond pointer checks, adding a layer of structural and metadata validation to help detect system corruption early.

Mark3 [Kernel](#) Configuration.

Macros

- `#define` [KERNEL_USE_TIMERS](#) (1)
The following options is related to all kernel time-tracking.
- `#define` [KERNEL_USE_QUANTUM](#) (1)
Do you want to enable time quanta? This is useful when you want to have tasks in the same priority group share time in a controlled way.
- `#define` [KERNEL_USE_SEMAPHORE](#) (1)
Do you want the ability to use counting/binary semaphores for thread synchronization? Enabling this features provides fully-blocking semaphores and enables all API functions declared in semaphore.h.
- `#define` [KERNEL_USE_MESSAGE](#) (1)
Enable inter-thread messaging using named mailboxes.
- `#define` [GLOBAL_MESSAGE_POOL_SIZE](#) (8)
If Messages are enabled, define the size of the default kernel message pool.
- `#define` [KERNEL_USE_MUTEX](#) (1)
Do you want the ability to use mutual exclusion semaphores (mutex) for resource/block protection? Enabling this feature provides mutexes, with priority inheritance, as declared in mutex.h.
- `#define` [KERNEL_USE_SLEEP](#) (1)
Do you want to be able to set threads to sleep for a specified time? This enables the [Thread::Sleep\(\)](#) API.
- `#define` [KERNEL_USE_DRIVER](#) (1)
Enabling device drivers provides a posix-like filesystem interface for peripheral device drivers.

- `#define KERNEL_USE_THREADNAME (1)`
Provide [Thread](#) method to allow the user to set a name for each thread in the system.
- `#define KERNEL_USE_DYNAMIC_THREADS (1)`
Provide extra [Thread](#) methods to allow the application to create (and more importantly destroy) threads at runtime.
- `#define KERNEL_USE_PROFILER (1)`
Provides extra classes for profiling the performance of code.
- `#define KERNEL_USE_DEBUG (0)`
Provides extra logic for kernel debugging, and instruments the kernel with extra asserts, and kernel trace functionality.

14.99.1 Detailed Description

Mark3 [Kernel](#) Configuration. This file is used to configure the kernel for your specific application in order to provide the optimal set of features for a given use case.

Since you only pay the price (code space/RAM) for the features you use, you can usually find a sweet spot between features and resource usage by picking and choosing features a-la-carte. This config file is written in an "interactive" way, in order to minimize confusion about what each option provides, and to make dependencies obvious.

As of 7.6.2012 on AVR, these are the costs associated with the various features:

Base [Kernel](#): 2888 bytes Tickless Timers: 1194 bytes Semaphores: 224 bytes [Message](#) Queues: 332 bytes (+ Semaphores) Mutexes: 290 bytes [Thread](#) Sleep: 162 bytes (+ Semaphores/Timers) Round-Robin: 304 bytes (+ Timers) Drivers: 144 bytes Dynamic Threads: 68 bytes [Thread](#) Names: 8 bytes Profiling Timers: 624 bytes

Definition in file [mark3cfg.h](#).

14.99.2 Macro Definition Documentation

14.99.2.1 `#define GLOBAL_MESSAGE_POOL_SIZE (8)`

If Messages are enabled, define the size of the default kernel message pool.

Messages can be manually added to the message pool, but this mechanism is more convenient and automatic.

Definition at line 99 of file [mark3cfg.h](#).

14.99.2.2 `#define KERNEL_USE_DRIVER (1)`

Enabling device drivers provides a posix-like filesystem interface for peripheral device drivers.

When enabled, the size of the filesystem table is specified in `DRIVER_TABLE_SIZE`. Permissions are enforced for driver access by thread ID and group when `DRIVER_USE_PERMS` are enabled.

Definition at line 127 of file [mark3cfg.h](#).

14.99.2.3 `#define KERNEL_USE_DYNAMIC_THREADS (1)`

Provide extra [Thread](#) methods to allow the application to create (and more importantly destroy) threads at runtime.

Useful for designs implementing worker threads, or threads that can be restarted after encountering error conditions.

Definition at line 142 of file [mark3cfg.h](#).

14.99.2.4 `#define KERNEL_USE_MESSAGE (1)`

Enable inter-thread messaging using named mailboxes.

If per-thread mailboxes are defined, each thread is allocated a default mailbox of a depth specified by `THREAD_MAILBOX_SIZE`.

Definition at line 88 of file [mark3cfg.h](#).

14.99.2.5 #define KERNEL_USE_MUTEX (1)

Do you want the ability to use mutual exclusion semaphores (mutex) for resource/block protection? Enabling this feature provides mutexes, with priority inheritance, as declared in [mutex.h](#).

Enabling per-thread mutex automatically allocates a mutex for each thread.

Definition at line 108 of file [mark3cfg.h](#).

14.99.2.6 #define KERNEL_USE_PROFILER (1)

Provides extra classes for profiling the performance of code.

Useful for debugging and development, but uses an additional timer.

Definition at line 148 of file [mark3cfg.h](#).

14.99.2.7 #define KERNEL_USE_QUANTUM (1)

Do you want to enable time quanta? This is useful when you want to have tasks in the same priority group share time in a controlled way.

This allows equal tasks to use unequal amounts of the CPU, which is a great way to set up CPU budgets per thread in a round-robin scheduling system. If enabled, you can specify a number of ticks that serves as the default time period (quantum). Unless otherwise specified, every thread in a priority will get the default quantum.

Definition at line 68 of file [mark3cfg.h](#).

14.99.2.8 #define KERNEL_USE_SEMAPHORE (1)

Do you want the ability to use counting/binary semaphores for thread synchronization? Enabling this features provides fully-blocking semaphores and enables all API functions declared in [semaphore.h](#).

If you have to pick one blocking mechanism, this is the one to choose. By also enabling per-thread semaphores, each thread will receive it's own built-in semaphore.

Definition at line 80 of file [mark3cfg.h](#).

14.99.2.9 #define KERNEL_USE_THREADNAME (1)

Provide [Thread](#) method to allow the user to set a name for each thread in the system.

Adds to the size of the thread member data.

Definition at line 134 of file [mark3cfg.h](#).

14.99.2.10 #define KERNEL_USE_TIMERS (1)

The following options is related to all kernel time-tracking.

-timers provide a way for events to be periodically triggered in a lightweight manner. These can be periodic, or one-shot.

-Thread [Quantum](#) (used for round-robin scheduling) is dependent on this module, as is [Thread](#) Sleep functionality.

Definition at line 56 of file [mark3cfg.h](#).

Classes

- class [Message](#)
Class to provide message-based IPC services in the kernel.
- class [GlobalMessagePool](#)
Implements a list of message objects shared between all threads.
- class [MessageQueue](#)
List of messages, used as the channel for sending and receiving messages between threads.

14.107.1 Detailed Description

Inter-thread communication via message-passing. Embedded systems guru Jack Ganssle once said that without a robust form of interprocess communications (IPC), an RTOS is just a toy. Mark3 implements a form of IPC to provide safe and flexible messaging between threads.

Using kernel-managed IPC offers significant benefits over other forms of data sharing (i.e. Global variables) in that it avoids synchronization issues and race conditions common to the practice. Using IPC also enforces a more disciplined coding style that keeps threads decoupled from one another and minimizes global data preventing careless and hard-to-debug errors.

14.107.2 Using Messages, Queues, and the Global Message Pool

```
// Declare a message queue shared between two threads
MessageQueue my_queue;

int main()
{
    ...
    // Initialize the message queue
    my_queue.init();
    ...
}

void Thread1()
{
    // Example TX thread - sends a message every 10ms
    while(1)
    {
        // Grab a message from the global message pool
        Message *tx_message = GlobalMessagePool::Pop();

        // Set the message data/parameters
        tx_message->SetCode( 1234 );
        tx_message->SetData( NULL );

        // Send the message on the queue.
        my_queue.Send( tx_message );
        Thread::Sleep(10);
    }
}

void Thread2()
{
    while()
    {
        // Blocking receive - wait until we have messages to process
        Message *rx_message = my_queue.Recv();

        // Do something with the message data...

        // Return back into the pool when done
        GlobalMessagePool::Push(rx_message);
    }
}
```

14.115 /home/moslevin/m3/embedded/stage/src/nlfs.h File Reference

Nice Little Filesystem (**NLFS**) - a simple, embeddable filesystem.

```
#include "kerneltypes.h"
#include <stdint.h>
```

Classes

- struct [NLFS_File_Node_t](#)
Data structure for the "file" FS-node type.
- struct [NLFS_Root_Node_t](#)
Data structure for the Root-configuration FS-node type.
- struct [NLFS_Node_t](#)
Filesystem node data structure.
- struct [NLFS_Block_t](#)
Block data structure.
- union [NLFS_Host_t](#)
Union used for managing host-specific pointers/data-types.
- struct [NLFS_File_Stat_t](#)
Structure used to report the status of a given file.
- class [NLFS](#)
Nice Little File System class.

Macros

- #define [PERM_UX](#) (0x0001)
Permission bit definitions.
- #define [PERM_UW](#) (0x0002)
- #define [PERM_UR](#) (0x0004)
- #define [PERM_U_ALL](#) ([PERM_UX](#) | [PERM_UW](#) | [PERM_UR](#))

Enumerations

- enum `NLFS_Type_t` {
`NLFS_NODE_FREE`, `NLFS_NODE_ROOT`, `NLFS_NODE_FILE`, `NLFS_NODE_DIR`,
`FILE_BLOCK_COUNTS` }

Enumeration describing the various types of filesystem nodes used by [NLFS](#).

14.115.1 Detailed Description

Nice Little Filesystem ([NLFS](#)) - a simple, embeddable filesystem. Introduction to the Nice-Little-Filesystem ([NLFS](#))
[NLFS](#) is yet-another filesystem intended for use in embedded applications.

It is intended to be portable, lightweight, and flexible in terms of supporting different types of physical storage media. In order to ensure that it's easily embeddable, there are no external library dependencies, aside from library code provided elsewhere in Mark3 (namely the [MemUtil](#) utility class). Balancing code-size with features and functionality is also a tradeoff - [NLFS](#) supports basic operations (create file, create directory, read, write, seek, and delete), without a lot of other bells and whistles. One other feature built into the filesystem is posix-style user-group permissions. While the APIs in the [NLFS](#) classes do not enforce permissions explicitly, application-specific implementations of [NLFS](#) can enforce permissions based on facilities based on the security mechanisms built into the host OS.

The original purpose of this filesystem was to provide a flexible way of packaging files for read-only use within Mark3 (such as scripts and compiled DCPU-16 objects). However, there are all sorts of purposes for this type of filesystem - essentially, any application where a built-in file manifest or resource container format.

[NLFS](#) is a block-based filesystem, composed of three separate regions of data structures within a linearly-addressed blob of storage. These regions are represented on the physical storage in the following order:

[File Nodes][Data Block Headers][Block Data]

The individual regions are as follows:

1) File Nodes

This region is composed of a linear array of equally-sized file-node ([NLFS_Node_t](#)) structures, starting at byte offset 0 in the underlying media.

Each node defines a particular file or directory within the filesystem. Because of the linear layout of the filesystem, the file nodes are all pre-allocated during the time of filesystem creation. As a result, care should be taken to ensure enough file nodes are allocated to meet the needs of your application, without wasting space in the filesystem for nodes that will never be needed.

The first two nodes (node 0 and node 1) are special in the [NLFS](#) implementation.

Node 0 is also known as the root filesystem node. This block contains a different internal data structure from other file nodes, and stores the configuration information for the particular filesystem, such as the number of file nodes, file blocks, block sizes, as well as indexes of the first free file and block nodes in the filesystem. With this information, it is possible to re-mount a filesystem created once in another location.

Node 1 is the mount-point for the filesystem, and is the root directory under which all other files and directories are found. By default Node 1 is simply named "/".

2) Block Headers

The block header region of the system comes after the file node region, and consists of a linear array of block node data structures. All storage in a filesystem not allocated towards file nodes is automatically allocated towards data blocks, and for each data block allocated, there is a block node data structure allocated within the block node region.

The [NLFS_Block_t](#) data structure contains a link to the next node in a block chain. If the block is free, the link points to the index of the next free block in the filesystem. If allocated, the link points to the index of the next block in the file. This structure also contains flags which indicate whether or not a block is free or allocated, and other flags used for filesystem continuity checks.

3) Block Data

The block data region is the last linear range in the filesystem, and consists of equally-sized blocks in the filesystem. Each block consists of a region of raw physical storage, without any additional metadata.

The contents of any files read or written to the filesystem is stored within the blocks in this region.

The [NLFS](#) Class has a number of virtual methods, which require that a user provides an implementation appropriate for the underlying physical storage medium from within a class inheriting [NLFS](#).

An example implementation for a RAM-based filesystem is provided in the [NLFS_RAM](#) class located within [nlfs_ram.cpp](#).

Definition in file [nlfs.h](#).

14.115.2 Enumeration Type Documentation

14.115.2.1 enum NLFS_Type_t

Enumeration describing the various types of filesystem nodes used by [NLFS](#).

A filesystem node is a fixed-sized data structure consisting of a type specifier, and a union of the data structures representing each possible block type.

Enumerator

NLFS_NODE_FREE File node is free.

NLFS_NODE_ROOT Root filesystem descriptor.

NLFS_NODE_FILE File node.

NLFS_NODE_DIR Directory node.

Classes

- class [ProfileTimer](#)
Profiling timer.

14.129.1 Detailed Description

High-precision profiling timers. Enables the profiling and instrumentation of performance-critical code. Multiple timers can be used simultaneously to enable system-wide performance metrics to be computed in a lightweight manner.

Usage:

```
ProfileTimer clMyTimer;
int i;

clMyTimer.Init();

// Profile the same block of code ten times
for (i = 0; i < 10; i++)
{
    clMyTimer.Start();
    ...
    //Block of code to profile
    ...
    clMyTimer.Stop();
}

// Get the average execution time of all iterations
ulAverageTimer = clMyTimer.GetAverage();

// Get the execution time from the last iteration
ulLastTimer = clMyTimer.GetCurrent();
```

[Thread](#) scheduler function declarations.

```

#include "kerneltypes.h"
#include "thread.h"

```

Classes

- class [Scheduler](#)

Priority-based round-robin [Thread](#) scheduling, using [ThreadLists](#) for housekeeping.

Macros

- `#define NUM_PRIORITIES (8)`

Variables

- `Thread * g_pstNext`
- `Thread * g_pstCurrent`

14.137.1 Detailed Description

`Thread` scheduler function declarations. This scheduler implements a very flexible type of scheduling, which has become the defacto industry standard when it comes to real-time operating systems. This scheduling mechanism is referred to as priority round- robin.

From the name, there are two concepts involved here:

1) Priority scheduling:

Threads are each assigned a priority, and the thread with the highest priority which is ready to run gets to execute.

2) Round-robin scheduling:

Where there are multiple ready threads at the highest-priority level, each thread in that group gets to share time, ensuring that progress is made.

The scheduler uses an array of `ThreadList` objects to provide the necessary housekeeping required to keep track of threads at the various priorities. As a result, the scheduler contains one `ThreadList` per priority, with an additional list to manage the storage of threads which are in the "stopped" state (either have been stopped, or have not been started yet).

Definition in file `scheduler.h`.

14.145 /home/moslevin/m3/embedded/stage/src/shell_support.h File Reference

Support functions & data structures useful in implementing a shell.

```

#include "kerneltypes.h"
#include "memutil.h"

```

Classes

- struct [Option_t](#)
Structure used to represent a command-line option with its arguments.
- struct [CommandLine_t](#)
Structure containing multiple representations for command-line data.
- struct [ShellCommand_t](#)
Data structure defining a lookup table correlating a command name to its handler function.
- class [ShellSupport](#)
The [ShellSupport](#) class features utility functions which handle token processing, option/parameter lookup, and functions making it generally trivial to implement a lightweight custom shell.

Macros

- #define [MIN](#)(x, y) (((x) < (y)) ? (x) : (y))
Utility macro used to return the lesser of two values/objects.
- #define [MAX](#)(x, y) (((x) > (y)) ? (x) : (y))
Utility macro used to return the greater of two values/objects.

Typedefs

- typedef K_CHAR(* [fp_internal_command](#))([CommandLine_t](#) *pstCommandLine_)
Function pointer type used to represent shell commands, as implemented by users of this infrastructure.

14.145.1 Detailed Description

Support functions & data structures useful in implementing a shell.

Definition in file [shell_support.h](#).

14.145.2 Typedef Documentation

14.145.2.1 typedef K_CHAR(* fp_internal_command)(CommandLine_t *pstCommandLine_)

Function pointer type used to represent shell commands, as implemented by users of this infrastructure.

Commands return a signed 8-bit result, and take a command-line argument structure as the first and only argument.

Definition at line 110 of file [shell_support.h](#).

Serial Line IP framing code.

```

#include "kerneltypes.h"
#include "driver.h"

```

Classes

- struct [SlipDataVector](#)
Data structure used for vector-based SLIP data transmission.
- class [Slip](#)
Object used to frame communications over an abstract device using the serial-line internet protocol (SLIP).

Enumerations

- enum [SlipChannel](#) {
[SLIP_CHANNEL_TERMINAL](#) = 0, [SLIP_CHANNEL_UNISCOPE](#), [SLIP_CHANNEL_NVM](#), [SLIP_CHANNEL_RESET](#),
[SLIP_CHANNEL_GRAPHICS](#), [SLIP_CHANNEL_HID](#), [SLIP_CHANNEL_COUNT](#) }

14.149.1 Detailed Description

Serial Line IP framing code. Also includes code to frame data in FunkenSlip format for use with [SlipTerm](#) on a host PC.

FunkenSlip uses SLIP-framed messages with a pre-defined packet format as follows:

[Channel][Size][Data Buffer][CRC8]

Channel is 1 byte, indicating the type of data carried in the message

Size is 2 bytes, indicating the length of the binary blob that follows

Data Buffer is n bytes, and contains the raw packet data.

CRC16 is 2 byte, Providing an error detection mechanism

Definition in file [slip.h](#).

14.149.2 Enumeration Type Documentation

14.149.2.1 enum SlipChannel

Enumerator

[SLIP_CHANNEL_TERMINAL](#) ASCII text mode terminal.
[SLIP_CHANNEL_UNISCOPE](#) Uniscope VM command channel.
[SLIP_CHANNEL_NVM](#) Non-volatile memory configuration.
[SLIP_CHANNEL_RESET](#) Channel used to reset the device...
[SLIP_CHANNEL_GRAPHICS](#) Encoded drawing commands.
[SLIP_CHANNEL_HID](#) HID commands.

```

Classes

- class [SystemHeap](#)

The [SystemHeap](#) class implements a heap which is accessible from all components in the system.

Macros

- `#define HEAP_RAW_SIZE_1 ((HEAP_BLOCK_SIZE_1 + sizeof(LinkListNode) + sizeof(void*)) * HEAP_BLOCK_COUNT_1)`
Really ugly computations used to auto-size the heap footprint based on the user-configuration data.
- `#define HEAP_RAW_SIZE_2 ((HEAP_BLOCK_SIZE_2 + sizeof(LinkListNode) + sizeof(void*)) * HEAP_BLOCK_COUNT_2)`
- `#define HEAP_RAW_SIZE_3 ((HEAP_BLOCK_SIZE_3 + sizeof(LinkListNode) + sizeof(void*)) * HEAP_BLOCK_COUNT_3)`
- `#define HEAP_RAW_SIZE_4 0`
- `#define HEAP_RAW_SIZE_5 0`
- `#define HEAP_RAW_SIZE_6 0`
- `#define HEAP_RAW_SIZE_7 0`
- `#define HEAP_RAW_SIZE_8 0`
- `#define HEAP_RAW_SIZE_9 0`

14.163 /home/moslevin/m3/embedded/stage/src/system_heap_config.h File Reference

System heap configuration - defines the block sizes and counts used to fulfill system/service allocations.

```
#include "kerneltypes.h"
```

Macros

- `#define USE_SYSTEM_HEAP (1)`
Set this to "1" if you want the system heap to be built as part of this library.
- `#define HEAP_NUM_SIZES (3)`
Define the number of heap block sizes that we want to have attached to our system heap.
- `#define HEAP_BLOCK_SIZE_1 ((K_USHORT) 8)`
Define the block sizes for each of the fixed-size blocks that will be managed by our heaps.
- `#define HEAP_BLOCK_SIZE_2 ((K_USHORT) 16)`
- `#define HEAP_BLOCK_SIZE_3 ((K_USHORT) 24)`
- `#define HEAP_BLOCK_SIZE_4 ((K_USHORT) 32)`
- `#define HEAP_BLOCK_SIZE_5 ((K_USHORT) 48)`
- `#define HEAP_BLOCK_SIZE_6 ((K_USHORT) 64)`
- `#define HEAP_BLOCK_SIZE_7 ((K_USHORT) 96)`
- `#define HEAP_BLOCK_SIZE_8 ((K_USHORT) 128)`
- `#define HEAP_BLOCK_SIZE_9 ((K_USHORT) 192)`
- `#define HEAP_BLOCK_SIZE_10 ((K_USHORT) 256)`
- `#define HEAP_BLOCK_COUNT_1 ((K_USHORT) 4)`
Define the number of blocks in each bin, tailored for a particular application.
- `#define HEAP_BLOCK_COUNT_2 ((K_USHORT) 4)`
- `#define HEAP_BLOCK_COUNT_3 ((K_USHORT) 2)`
- `#define HEAP_BLOCK_COUNT_4 ((K_USHORT) 2)`
- `#define HEAP_BLOCK_COUNT_5 ((K_USHORT) 2)`
- `#define HEAP_BLOCK_COUNT_6 ((K_USHORT) 2)`
- `#define HEAP_BLOCK_COUNT_7 ((K_USHORT) 1)`
- `#define HEAP_BLOCK_COUNT_8 ((K_USHORT) 1)`
- `#define HEAP_BLOCK_COUNT_9 ((K_USHORT) 1)`
- `#define HEAP_BLOCK_COUNT_10 ((K_USHORT) 1)`

14.163.1 Detailed Description

System heap configuration - defines the block sizes and counts used to fulfill system/service allocations.

Definition in file [system_heap_config.h](#).

14.163.2 Macro Definition Documentation

14.163.2.1 #define HEAP_BLOCK_SIZE_1 ((K_USHORT) 8)

Define the block sizes for each of the fixed-size blocks that will be managed by our heaps.

Must be defined in incrementing order.

Definition at line 44 of file [system_heap_config.h](#).

14.164 system_heap_config.h

Classes

- class [Thread](#)
Object providing fundamental multitasking support in the kernel.

Macros

- #define [THREAD_QUANTUM_DEFAULT](#) (4)
Suggested default thread quantum.

Typedefs

- typedef void(* [ThreadEntry_t](#))(void *pvArg_)
Function pointer type used for thread entryptoint functions.

14.167.1 Detailed Description

Platform independent thread class declarations. Threads are an atomic unit of execution, and each instance of the thread class represents an instance of a program running on the processor. The [Thread](#) is the fundamental user-facing object in the kernel - it is what makes multiprocessing possible from application code.

In Mark3, threads each have their own context - consisting of a stack, and all of the registers required to multiplex a processor between multiple threads.

The [Thread](#) class inherits directly from the [LinkListNode](#) class to facilitate efficient thread management using Double, or Double-Circular linked lists.

Definition in file [thread.h](#).

14.168 thread.h

Classes

- class [ThreadPort](#)

Class defining the architecture specific functions required by the kernel.

Macros

- #define [ASM](#)(x) asm volatile(x);
ASM Macro - simplify the use of ASM directive in C.
- #define [SR_](#) 0x3F
Status register define - map to 0x003F.
- #define [SPH_](#) 0x3E
Stack pointer define.
- #define [SPL_](#) 0x3D
- #define [TOP_OF_STACK](#)(x, y) (K_UCHAR*) (((K_USHORT)x) + (y-1))
Macro to find the top of a stack given its size and top address.
- #define [PUSH_TO_STACK](#)(x, y) *x = y; x--;
Push a value y to the stack pointer x and decrement the stack pointer.
- #define [Thread_SaveContext](#)()
Save the context of the [Thread](#).
- #define [Thread_RestoreContext](#)()
Restore the context of the [Thread](#).
- #define [CS_ENTER](#)()
These macros must be used in pairs !
- #define [CS_EXIT](#)()
Exit critical section (restore status register)
- #define [ENABLE_INTS](#)() [ASM](#)("sei");
Initiate a contex switch without using the SWI.
- #define [DISABLE_INTS](#)() [ASM](#)("cli");

14.175.1 Detailed Description

ATMega328p Multithreading support.

Definition in file [threadport.h](#).

14.175.2 Macro Definition Documentation

14.175.2.1 #define CS_ENTER()

Value:

```
{ \
volatile K_UCHAR x; \
x = _SFR_IO8(SR\_); \
ASM("cli");
```

These macros *must* be used in pairs !

Enter critical section (copy status register, disable interrupts)

Definition at line [142](#) of file [threadport.h](#).

14.175.2.2 #define CS_EXIT()

Value:

```
_SFR_IO8(SR_) = x;\n}
```

Exit critical section (restore status register)

Definition at line 149 of file [threadport.h](#).

14.176 threadport.h

Macros

- `#define __FILE_ID__ TIMERLIST_CPP`
- `#define TL_FUDGE_FACTOR (0)`

Number of ticks to account for overhead when performing Time->tick computations.

14.177.1 Detailed Description

[Timer](#) data structure + scheduler implementations.

Definition in file [timerlist.cpp](#).

14.177.2 Macro Definition Documentation

14.177.2.1 `#define TL_FUDGE_FACTOR (0)`

Number of ticks to account for overhead when performing Time->tick computations.

This must be calibrated on a per-device basis. This value is currently Set up for a 16-bit timer, with a 256 prescaler, 16MHz clock, on an ATmega328p (i.e. ARDUINO UNO).

!! Note - this is deprecated. Better to have slightly long-cycled timers than potentially short-cycled timers.

Definition at line 47 of file [timerlist.cpp](#).

Classes

- class [Timer](#)
Timer - an event-driven execution context based on a specified time interval.
- class [TimerList](#)
TimerList class - a doubly-linked-list of timer objects.
- class [TimerScheduler](#)
"Static" Class used to interface a global [TimerList](#) with the rest of the kernel.

Macros

- #define [TIMERLIST_FLAG_ONE_SHOT](#) (0x01)
Timer is one-shot.
- #define [TIMERLIST_FLAG_ACTIVE](#) (0x02)
Timer is currently active.
- #define [TIMERLIST_FLAG_CALLBACK](#) (0x04)
Timer is pending a callback.
- #define [TIMERLIST_FLAG_EXPIRED](#) (0x08)
Timer is actually expired.
- #define [MAX_TIMER_TICKS](#) (0x7FFFFFFF)
Maximum value to set.
- #define [SECONDS_TO_TICKS](#)(x) (((K_ULONG)x) * TIMER_FREQ))
- #define [MSECONDS_TO_TICKS](#)(x) (((((K_ULONG)x) * (TIMER_FREQ/100)) + 5) / 10))
- #define [USECONDS_TO_TICKS](#)(x) (((((K_ULONG)x) * TIMER_FREQ) + 50000) / 1000000))
- #define [MIN_TICKS](#) (3)
The minimum tick value to set.

Typedefs

- typedef void(* [TimerCallback_t](#))([Thread](#) *pclOwner_, void *pvData_)

14.179.1 Detailed Description

[Timer](#) list and timer-scheduling declarations. These classes implements a linked list of timer objects attached to the global kernel timer. Unlike other kernels which use a fully-synchronous "tick-based" timing mechanism, where the OS timing facilities are based on a fixed-frequency timer (which causes regular timer interrupts), Mark3 uses a "tickless" timer implementation, which only triggers interrupts when absolutely required. This is much more efficient in most cases - timer interrupts occur less frequently, allowing the kernel to stay in sleep much longer than it would otherwise.

14.191 /home/moslevin/m3/embedded/stage/src/writebuf16.h File Reference

Thread-safe circular buffer implementation with 16-bit elements.

```
#include "kerneltypes.h"
```

Classes

- class [WriteBuffer16](#)

This class is used to provide a general-purpose, fully thread-safe circular buffer implementation which can be used for creating tracebuffers, data logging queues, transaction queues, etc.

Typedefs

- typedef void(* [WriteBufferCallback](#))(K_USHORT *pusData_, K_USHORT usSize_)

Function pointer type used to define a callback handler for when the circular buffer reaches 50% capacity..

14.191.1 Detailed Description

Thread-safe circular buffer implementation with 16-bit elements.

Definition in file [writebuf16.h](#).
